

METHOD FOR FORMING A CARBON-CARBON OR  
CARBON-HETEROATOM BOND

The subject of the present invention is a method for  
5 creating a carbon-carbon or carbon-heteroatom bond by the  
reaction of an unsaturated compound carrying a leaving  
group and a nucleophilic compound, in the absence of a  
ligand.

10 The invention relates in particular to the creation of a  
carbon-nitrogen bond according to a method for the  
arylation of nitrogen-containing organic derivatives.

15 There are numerous major compounds which are used in the  
agrochemical and pharmaceutical fields, for example  
arylhydrazines, which result from the arylation of a  
nucleophilic compound by the creation of a carbon-  
nitrogen bond.

20 A conventional method of arylation consists in using the  
Ullmann reaction (Ullmann F. and Kipper H., *Ber. dtsch.  
Chem. Ges.* **1905**, *38*, 2120-2126), by the prolonged heating  
of reagents at high temperature, in the presence of  
catalytic or stoichiometric copper. The reactions are  
25 often limited to the use of aryl iodides and their yields  
are reduced by the competitive formation of products of  
biaryl homocoupling.

30 Arylation reactions involve a catalyst and several types  
of catalysts have been described.

Palladium was used by Buchwald et al. to carry out in  
particular the reaction for arylation of indoles (*Org.  
Lett.* **2000**, *2*, 1403-1406), in the presence of a base, in  
35 toluene at 80°C - 100°C. Generally, the yields are  
satisfactory but the reaction temperature remains

nevertheless high for this type of palladium-based catalyst.

5 Copper has also been used (Chiriac et al., *Rev. Roum. Chim.* **1969**, 14, 1263-1267) to carry out the arylation of sodium salts of pyrazoles by iodobenzene in the presence of a catalytic quantity of copper, under refluxing DMF. The conditions described are very hard, the temperature is 153°C and the reaction time is very long, from 30 to  
10 40 hours.

15 Beletskaya et al. (*Tetrahedron Lett.* **1998**, 39, 5617-5622) have proposed to combine palladium with copper in the case of the N-arylation of benzotriazole. The presence of copper is essential in order to control the selectivity of the reaction. The catalysis is a phase-transfer catalysis which is not easy to carry out on an industrial scale.

20 Moreover, it has been proposed, according to WO 98/00399, to use a nickel catalyst, but the latter has proved scarcely effective for carrying out the arylation of heterocycles such as imidazole.

25 Chen et al. have also described (*J. Chem. RES. (S)* **2000**, 367-369), the arylation of azoles from diaryliodonium salts, in the presence of a cobalt catalyst, under phase-transfer conditions.

30 Buchwald et al. (*J. Am. Chem. Soc.* **2001**, 123, 7727-7729) have recently developed a method for the arylation of nitrogen-containing nucleophilic compounds catalyzed by copper. Its catalytic system, composed of a catalyst which is insensitive to air, copper(I) iodide and *trans*-  
35 1,2-diaminocyclohexane ligand, allows the arylation, in dioxane at 110°C, of heterocycles such as pyrazoles,

indoles, carbazole, pyrrole, indazole, imidazole, phthalazinone and 7-azaindole.

It is evident from an examination of the state of the art  
5 that up until now, copper has always been combined with a  
ligand.

The objective of the present invention is to provide a  
method which overcomes the abovementioned disadvantages  
and which makes it possible to deal with a very large  
10 number of nucleophilic compounds.

More specifically, the subject of the present invention  
is a method for creating a carbon-carbon or carbon-  
heteroatom bond by the reaction of an unsaturated  
15 compound carrying a leaving group and a nucleophilic  
compound donating a carbon atom or a heteroatom (HE)  
capable of substituting for the leaving group, thus  
creating a C-C or C-HE bond, in the presence of a copper-  
based catalyst and a base, characterized in that the  
20 reaction takes place in the absence of a ligand and in a  
nitrile-type solvent.

It has now been found that it is possible to carry out  
the coupling between an unsaturated substrate and a  
25 nucleophilic compound in the absence of a ligand as long  
as the reaction is carried out in a nitrile-type solvent,  
preferably acetonitrile.

According to a first variant of the method of the  
30 invention, an arylation reaction is carried out by  
reacting an aromatic compound carrying a leaving group  
and a nucleophilic compound.

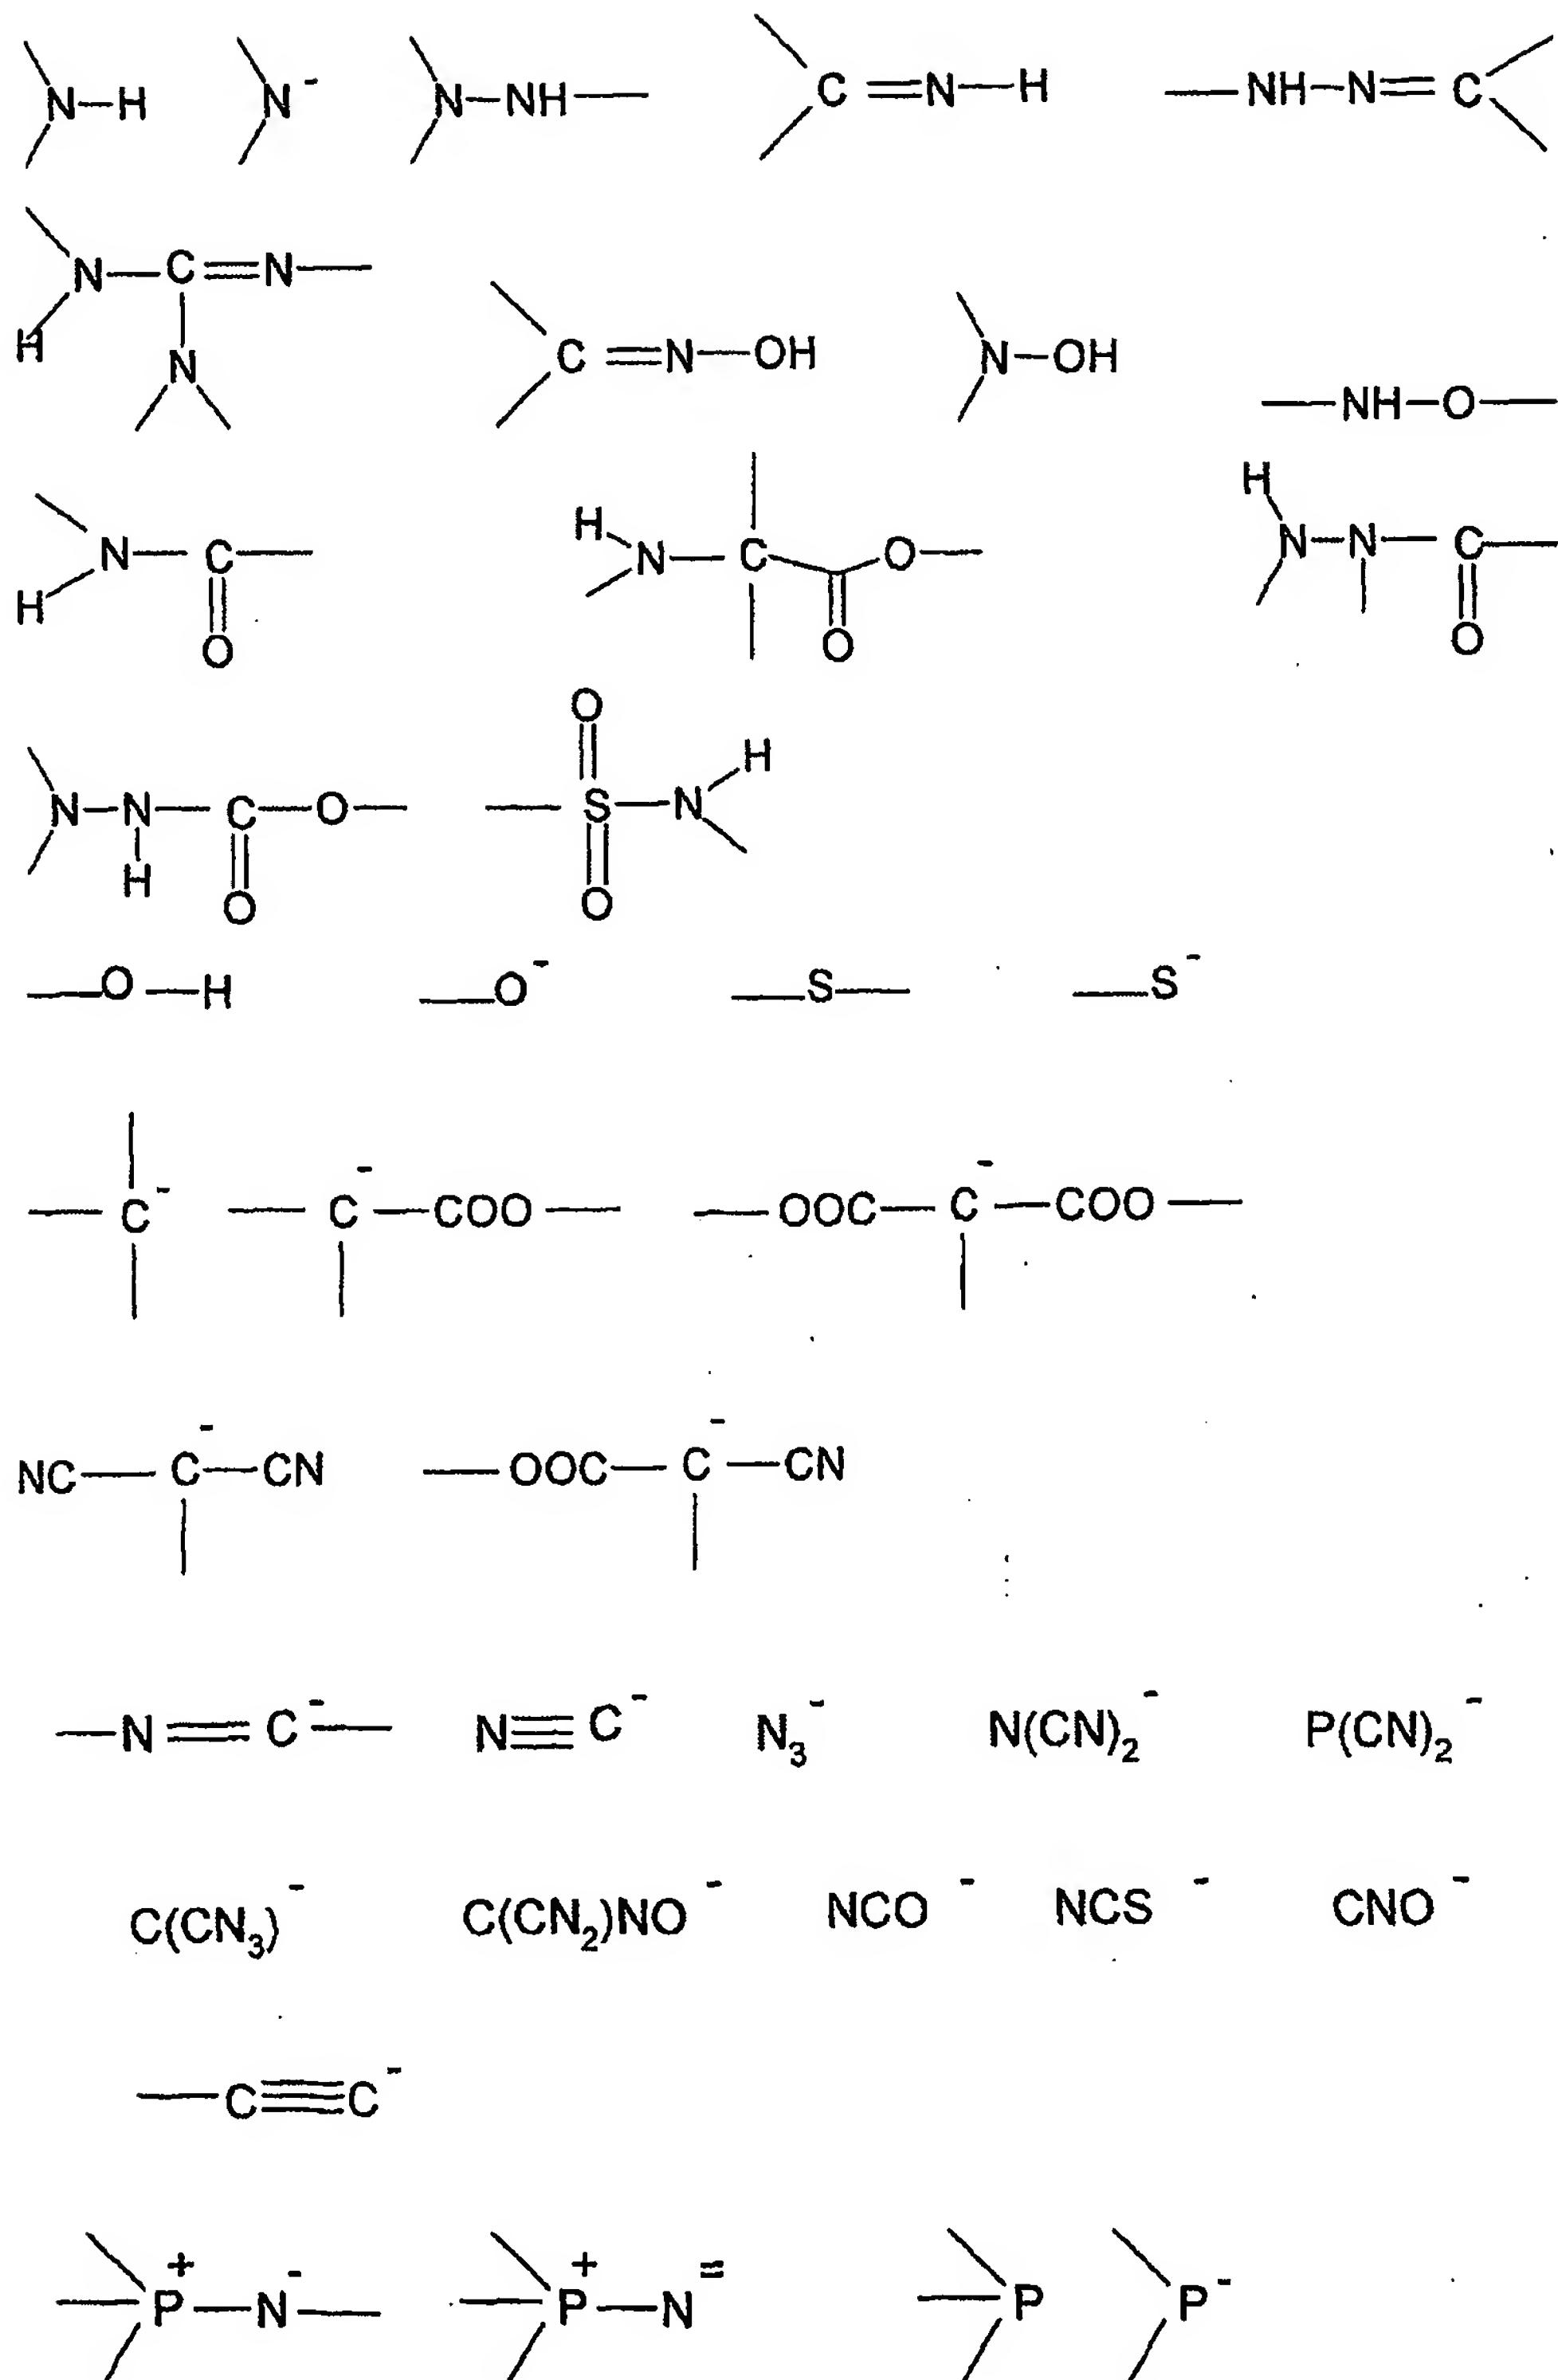

According to another variant of the method of the  
35 invention, a vinylation reaction is carried out by

reacting, respectively, a compound having a double bond at the  $\alpha$ -position with respect to a leaving group and a nucleophilic compound.

- 5 In the text which follows in the present invention, the term "arylation" is used in a broad sense since the use of an unsaturated compound carrying a leaving group which is either of the unsaturated aliphatic type, or of the carbocyclic or heterocyclic aromatic type, is envisaged.
- 10 The expression "nucleophilic compound" is understood to mean an organic hydrocarbon compound which may be acyclic or cyclic and whose characteristic is to comprise at least one atom carrying a free doublet which may or may not comprise a charge, and preferably a nitrogen, oxygen, 15 phosphorus or carbon atom.

As mentioned above, the nucleophilic compound comprises at least one atom carrying a free doublet which may be donated by a functional group and/or a carbanion.

- 20 As functional groups comprising said atoms and/or carbanions, the following atoms and groups may be mentioned in particular:

According to another variant of the invention, the nucleophilic compound comprises at least one nitrogen atom carrying a free doublet contained in a saturated,  
5

unsaturated or aromatic ring: the ring generally comprising from 3 to 8 atoms.

It should be noted that when the nucleophilic compound 5 comprises a functional group, of which examples are given above, which carries one or two negative charges, said compound is then in a salified form. The counter-ion is generally a metal cation such as an alkali metal, preferably sodium or lithium, an alkaline-earth metal, 10 preferably calcium, or the residue of an organometallic compound such as in particular a magnesium or zinc compound.

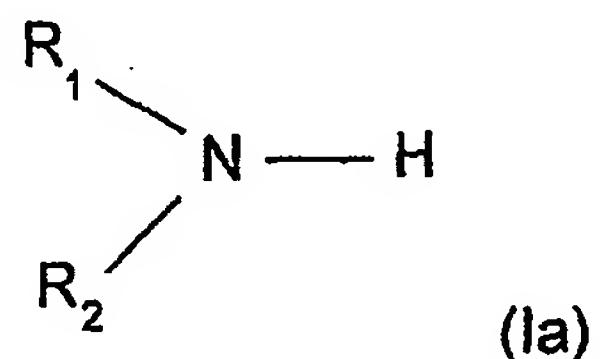

Nucleophilic compounds

15

The method of the invention involves a large number of nucleophilic compounds and examples are given below, by way of illustration and with no limitation being implied.

20 A first category of substrates to which the method of the invention applies are the primary or secondary amines and the imines.

25 More specifically, the primary or secondary amines may be represented by a general formula:

in said formula (Ia):

30 -  $R_1$  and  $R_2$  represent, independently of each other, a hydrogen atom or a hydrocarbon group having from 1 to 20 carbon atoms which may be a saturated or unsaturated, linear or branched acyclic aliphatic group; a monocyclic or polycyclic, saturated, unsaturated or aromatic carbocyclic or heterocyclic

group; a succession of the abovementioned groups,  
- at most one of the groups  $R_1$  and  $R_2$  represents a  
hydrogen atom.

5 In formula (Ia), the various symbols may have more  
particularly the meaning given below.

Thus,  $R_1$  and  $R_2$  may represent, independently of each  
10 other, a saturated or unsaturated, linear or branched  
acyclic aliphatic group.

More specifically,  $R_1$  and  $R_2$  preferably represent a  
saturated, linear or branched acyclic aliphatic group,  
preferably as  $C_1$  to  $C_{12}$ , and more preferably still as  $C_1$  to  
15  $C_4$ .

The invention does not exclude the presence of an  
unsaturation in the hydrocarbon chain, such as one or  
more double bonds which may be conjugated or  
20 unconjugated.

The hydrocarbon chain may be optionally interrupted by a  
heteroatom (for example oxygen, sulfur, nitrogen or  
phosphorus) or by a functional group insofar as the  
25 latter does not react, and there may be mentioned in  
particular a group such as in particular  $-CO-$ .

The hydrocarbon chain may optionally carry one or more  
substituents (for example halogen, ester, amino or alkyl  
30 and/or arylphosphine) insofar as there is no  
interference.

The saturated or unsaturated, linear or branched acyclic  
aliphatic group may optionally carry a cyclic  
35 substituent. The expression ring is understood to mean a  
saturated, unsaturated or aromatic carbocyclic or

heterocyclic ring.

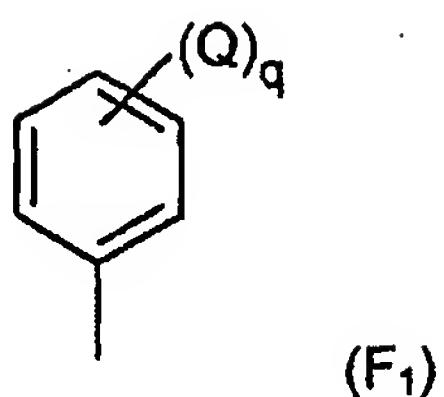

The acyclic aliphatic group may be attached to the ring by a valency bond, a heteroatom or a functional group  
5 such as oxy, carbonyl, carboxyl, sulfonyl and the like.

As examples of cyclic substituents, it is possible to envisage aromatic or heterocyclic cycloaliphatic substituents, in particular cycloaliphatic substituents  
10 comprising 6 carbon atoms in the ring or benzene substituents, these cyclic substituents themselves optionally carrying any substituent insofar as they do not hamper the reactions involved in the method of the invention. C<sub>1</sub> to C<sub>4</sub> alkoxy or alkyl groups may be  
15 mentioned in particular.

Among the aliphatic groups carrying a cyclic substituent, reference may be made more particularly to cycloalkylalkyl, for example cyclohexylalkyl, groups, or  
20 preferably C<sub>7</sub> to C<sub>12</sub> arylalkyl, in particular benzyl or phenylethyl, groups.

In general formula (Ia), the groups R<sub>1</sub> and R<sub>2</sub> may also represent, independently of each other, a saturated  
25 carbocyclic group comprising one or two unsaturations in the ring, generally as C<sub>3</sub> to C<sub>8</sub>, preferably having 6 carbon atoms in the ring; it being possible for said ring to be substituted. As preferred examples of this type of groups, there may be mentioned cyclohexyl groups  
30 optionally substituted with linear or branched alkyl groups, having from 1 to 4 carbon atoms.

The groups R<sub>1</sub> and R<sub>2</sub> may represent, independently of each other, an aromatic hydrocarbon, and in particular a  
35 benzene, group corresponding to general formula (F<sub>1</sub>):

(F<sub>1</sub>)

in which:

- q represents an integer from 0 to 5,
- Q represents a group chosen from a linear or branched C<sub>1</sub> to C<sub>6</sub> alkyl group, a linear or branched C<sub>1</sub> to C<sub>6</sub> alkoxy group, a linear or branched C<sub>1</sub> to C<sub>6</sub> alkylthio group, an -NO<sub>2</sub> group, a -CN group, a halogen atom, a CF<sub>3</sub> group.

10 R<sub>1</sub> and R<sub>2</sub> may also represent, independently of each other, a polycyclic aromatic hydrocarbon group with rings which can form with each other ortho-fused, ortho- and peri-fused systems. There may also be mentioned, more particularly, a naphthyl group; it being possible for 15 said ring to be substituted.

R<sub>1</sub> and R<sub>2</sub> may also represent, independently of each other, a polycyclic hydrocarbon group consisting of at least 2 saturated and/or unsaturated carbocycles or of at least 2 carbocycles of which at least one is aromatic, and forming with each other ortho- or ortho- and peri-fused systems. Generally, the rings are C<sub>3</sub> to C<sub>8</sub>, preferably C<sub>6</sub>. As more particular examples, there may be mentioned the bornyl group or the tetrahydronaphthalene group.

25

R<sub>1</sub> and R<sub>2</sub> may also represent, independently of each other, a saturated, unsaturated or aromatic heterocyclic group containing in particular 5 or 6 atoms in the ring, of which one or two heteroatoms such as nitrogen (not substituted with a hydrogen atom), sulfur and oxygen atoms; it being possible for the carbon atoms of this heterocycle to also be substituted.

R<sub>1</sub> and R<sub>2</sub> may also represent a polycyclic heterocyclic group defined as being either a group consisting of at least 2 aromatic or nonaromatic heterocycles containing 5 at least one heteroatom in each ring and forming with each other ortho- or ortho- and peri-fused systems, or a group consisting of at least one aromatic or nonaromatic hydrocarbon ring and at least one aromatic or nonaromatic heterocycle forming with each other ortho- or ortho- and 10 peri-fused systems; it being possible for the carbon atoms of said rings to be optionally substituted.

By way of examples of R<sub>1</sub> and R<sub>2</sub> groups of the heterocyclic type, there may be mentioned, inter alia, furyl, thienyl, 15 isoxazolyl, furazanyl, isothiazolyl, pyridyl, pyridazinyl, pyrimidinyl, pyranyl, phosphino groups and quinolyl, naphthyridinyl, benzopyranyl and benzofuranyl groups.

20 The number of substituents present on each ring depends on the carbon condensation of the ring and the presence or absence of unsaturation in the ring. The maximum number of substituents which may be carried by a ring is easily determined by a person skilled in the art.

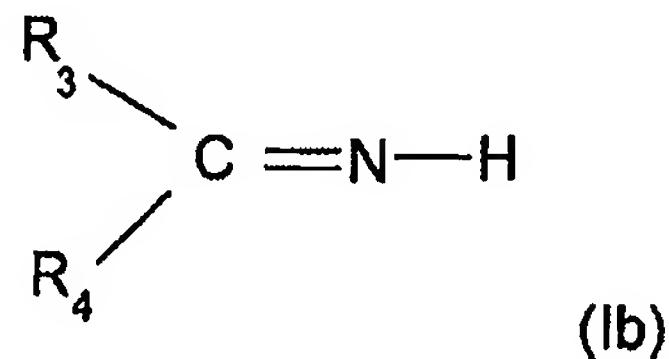

25 The amines used preferably correspond to formula (Ia) in which R<sub>1</sub> and R<sub>2</sub>, which are identical or different, represent a C<sub>1</sub> to C<sub>15</sub>, preferably C<sub>1</sub> to C<sub>10</sub>, alkyl group, a C<sub>3</sub> to C<sub>8</sub>, preferably C<sub>5</sub> to C<sub>6</sub>, cycloalkyl group, a C<sub>6</sub> to C<sub>12</sub> 30 aryl or arylalkyl group.

As more particular examples of R<sub>1</sub> and R<sub>2</sub> groups, there may be mentioned the C<sub>1</sub> to C<sub>4</sub> alkyl, phenyl, benzyl or naphthyl groups.

35 As more specific examples of amines corresponding to

formula (Ia), there may be mentioned aniline, N-methyl-aniline, diphenylamine, benzylamine and dibenzylamine.

As regards the imines, they may be represented by the  
5 following formula:

in said formula:

- $R_3$  and  $R_4$ , which are identical or different, have the meaning given for  $R_1$  and  $R_2$  in formula (Ia),
- 10 - at most one of the groups  $R_3$  and  $R_4$  represents a hydrogen atom.

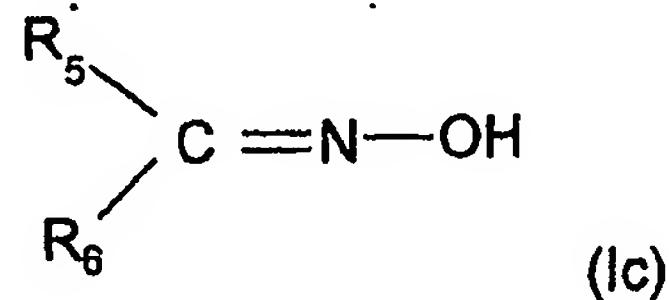

The imines used preferably correspond to formula (Ib) in which  $R_3$  and  $R_4$ , which are identical or different, represent a  $C_1$  to  $C_{15}$ , preferably  $C_1$  to  $C_{10}$ , alkyl group, a  $C_3$  to  $C_8$ , preferably  $C_5$  or  $C_6$ , cycloalkyl group, a  $C_6$  to  $C_{12}$  aryl or arylalkyl group.

As more particular examples of groups  $R_3$  and  $R_4$ , there may  
20 be mentioned the  $C_1$  to  $C_4$  alkyl, phenyl, benzyl or naphthyl groups.

Other nucleophiles which may be used in the method of the invention are oximes and hydroxylamines.

25

The oximes may be represented by the following formula:

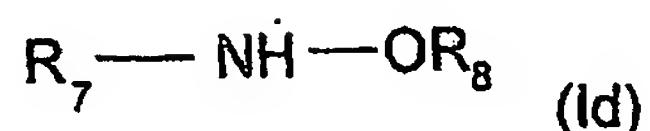

in said formula:

- $R_5$  and  $R_6$ , which are identical or different, have the

meaning given for  $R_1$  and  $R_2$  in formula (Ia),  
- at most one of the groups  $R_5$  and  $R_6$  represents a hydrogen atom.

5 The hydroxyamines may be represented by the following formula:

in said formula:

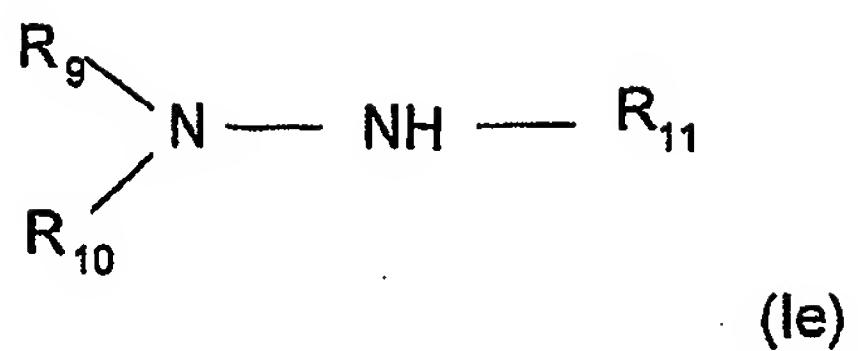

-  $R_7$  has the meaning given for  $R_1$  and  $R_2$  in formula (Ia) with the exception of a hydrogen atom,  
10 -  $R_8$  represents a hydrogen atom, a saturated or unsaturated, linear or branched acyclic aliphatic group; a monocyclic or polycyclic, saturated or unsaturated carbocyclic group; a succession of the  
15 abovementioned groups.

The oximes or hydroxylamines preferably used correspond to the formulae (Ic) or (Id) in which  $R_5$ ,  $R_6$  and  $R_7$  represent more particularly a  $C_1$  to  $C_{15}$ , preferably  $C_1$  to 20  $C_{10}$ , alkyl group, a  $C_3$  to  $C_8$ , preferably  $C_5$  or  $C_6$ , cycloalkyl group, a  $C_6$  to  $C_{12}$  aryl or arylalkyl group.

As more particular examples of groups  $R_5$ ,  $R_6$  and  $R_7$ , there may be mentioned  $C_1$  to  $C_4$  alkyl, phenyl, benzyl or 25 naphthyl groups.

As regards  $R_8$ , it is preferably a  $C_1$  to  $C_4$  alkyl group or a benzyl group.

30 The invention relates more particularly to the nucleophilic compounds of hydrazine-type. They may be symbolized by the following formula:

in said formula:

- $\text{R}_9$ ,  $\text{R}_{10}$  and  $\text{R}_{11}$ , which are identical or different, have the meaning given for  $\text{R}_1$  and  $\text{R}_2$  in formula (Ia),
- 5 -  $\text{R}_{11}$  represents a hydrogen atom or a protecting group  $\text{G}$ ,
- at least one of the groups  $\text{R}_9$ ,  $\text{R}_{10}$  or  $\text{R}_{11}$  is not a hydrogen atom,
- or alternatively  $\text{R}_9$  and  $\text{R}_{10}$  may be linked so as to 10 constitute, with the carbon atoms carrying them, a monocyclic or polycyclic, saturated, unsaturated or aromatic carbocyclic or heterocyclic group having from 3 to 20 atoms.

15 The hydrazines preferably used correspond to the formula (Ia) in which  $\text{R}_9$  and  $\text{R}_{10}$ , which are identical or different, represent a  $\text{C}_1$  to  $\text{C}_{15}$ , preferably  $\text{C}_1$  to  $\text{C}_{10}$ , alkyl group, a  $\text{C}_3$  to  $\text{C}_8$ , preferably  $\text{C}_5$  or  $\text{C}_6$ , cycloalkyl group, a  $\text{C}_6$  to  $\text{C}_{12}$  aryl or arylalkyl group.

20 As more particular examples of groups  $\text{R}_9$  and  $\text{R}_{10}$ , there may be mentioned the  $\text{C}_1$  to  $\text{C}_4$  alkyl, phenyl, benzyl or naphthyl groups.

25  $\text{R}_9$  and  $\text{R}_{10}$  may be linked so as to constitute, with the carbon atoms carrying them, a monocyclic or polycyclic, saturated, unsaturated or aromatic carbocyclic or heterocyclic group having from 3 to 20 atoms, comprising two or three ortho-fused rings, which means that at least 30 two rings have two carbon atoms in common. In the case of the polycyclic compounds, the number of atoms in each ring preferably varies between 3 and 6.  $\text{R}_9$  and  $\text{R}_{10}$  preferably form a cyclohexane or fluorenone type ring.

In formula (Ie),  $R_{11}$  more particularly represents a hydrogen atom, an alkyl group, preferably as  $C_1$  to  $C_{12}$ ; an alkenyl or alkynyl group, preferably as  $C_2$  to  $C_{12}$ ; a 5 cycloalkyl group, preferably as  $C_3$  to  $C_{12}$ ; an aryl or arylalkyl group, preferably as  $C_6$  to  $C_{12}$ .

$R_{11}$  preferably represents a hydrogen atom or a  $C_1$ - $C_4$  alkyl group.

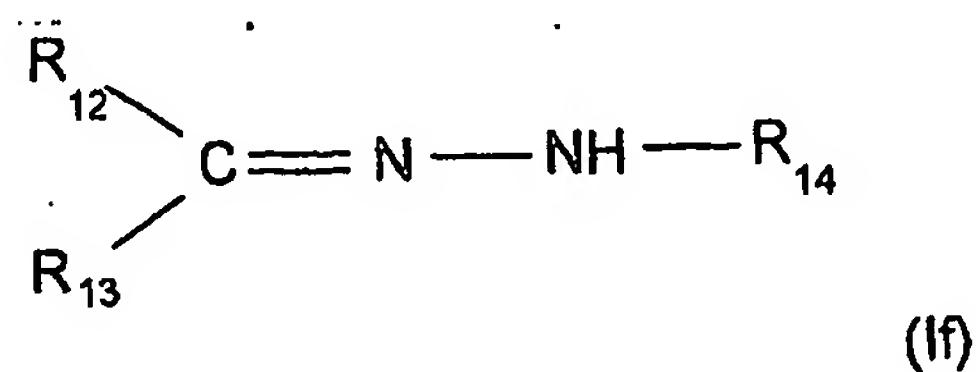

10 It should be noted that when the nucleophilic substrate comprises an  $NH_2$  group in which the two hydrogen atoms are capable of reacting, it is possible, in order to improve the selectivity of the reaction, to block one of them, with the aid of a protecting group. Use is made of the 15 protecting groups commonly used for this purpose, and mention may be made in particular of groups such as acyl (acetyl, benzoyl), BOC (butyloxycarbonyl), CBZ (carbobenzoxy), Fmoc (trifluoromethyloxycarbonyl) or MSOC (methanesulfonyl-2-ethoxycarbonyl).

20

Reference may be made to the text book by Theodora W. Greene et al., *Protective Groups in Organic Synthesis*, (2nd edition) John Wiley & Sons, Inc to carry out the protection of the amino group and its deprotection.

25

As other types of nucleophilic substrates, hydrazones may be mentioned. They may be represented by the following formula:

30 in said formula:

-  $R_{12}$ ,  $R_{13}$  and  $R_{14}$ , which are identical or different, have the meaning given for  $R_1$  and  $R_2$  in formula (Ia),

- at most one of the groups  $R_{12}$  and  $R_{13}$  represents a hydrogen atom,
- or alternatively,  $R_{12}$  and  $R_{13}$  may be linked so as to constitute, with the carbon atoms carrying them, a monocyclic or polycyclic, saturated, unsaturated or aromatic carbocyclic or heterocyclic group having from 3 to 20 atoms.

5 The hydrazones preferably used correspond to formula (If), in which  $R_{12}$  and  $R_{13}$ , which are identical or 10 different, represent a  $C_1$  to  $C_{15}$ , preferably  $C_1$  to  $C_{10}$ , alkyl group, a  $C_3$  to  $C_8$ , preferably  $C_5$  or  $C_6$ , cycloalkyl group, a  $C_6$  to  $C_{12}$  aryl or arylalkyl group.

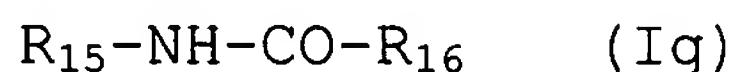

15 As more particular examples of groups  $R_{12}$  and  $R_{13}$ , there may be mentioned the  $C_1$  to  $C_4$  alkyl, phenyl, benzyl or naphthyl groups.

20  $R_{12}$  and  $R_{13}$  may be linked so as to constitute, with the carbon atoms carrying them, a monocyclic or polycyclic, saturated, unsaturated or aromatic carbocyclic or 25 heterocyclic group having from 3 to 20 carbon atoms, comprising two or three ortho-fused rings. In the case of the polycyclic compounds, the number of atoms in each ring preferably varies between 3 and 6.  $R_{12}$  and  $R_{13}$  preferably form a cyclohexane or fluorenone type ring.

30 In formula (If),  $R_{14}$  more particularly represents a hydrogen atom, an alkyl group, preferably as  $C_1$  to  $C_{12}$ ; an alkenyl or alkynyl group, preferably as  $C_2$  to  $C_{12}$ ; a cycloalkyl group, preferably as  $C_3$  to  $C_{12}$ ; an aryl or 35 arylalkyl group, preferably as  $C_6$  to  $C_{12}$ .

$R_{14}$  preferably represents a hydrogen atom or a  $C_1$ - $C_4$  alkyl group.

The invention also relates to the amide-type compounds corresponding more particularly to formula (Ig):

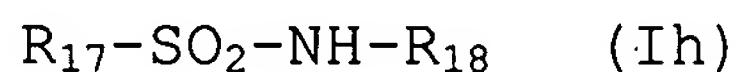

in said formula (Ig),  $R_{15}$  and  $R_{16}$  have the meaning given 5 for  $R_1$  and  $R_2$  in formula (Ia).

As examples of compounds of formula (Ig), there may be mentioned oxazolidine-2-one, benzamide, acetamide.

10 The invention also applies to sulfonamide-type compounds.

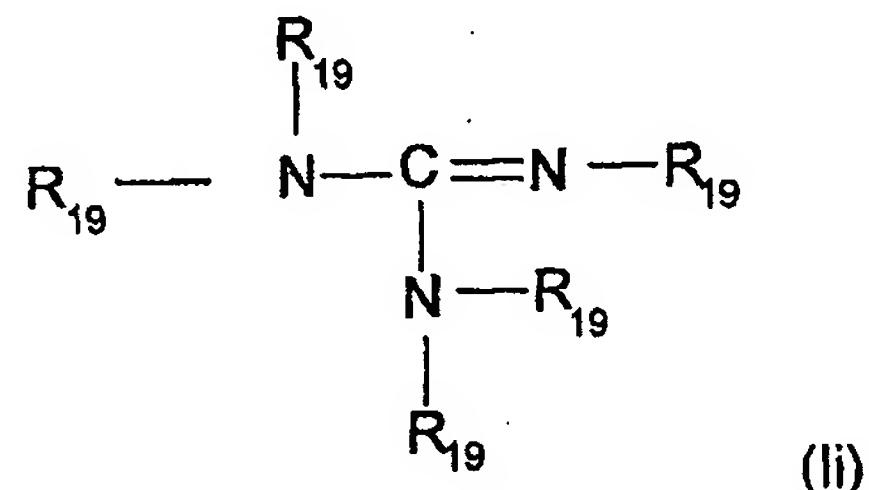

They may correspond to the following formula:

in said formula (Ih),  $R_{17}$  and  $R_{18}$  have the meaning given 15 for  $R_1$  and  $R_2$  in formula (Ia).

As examples of compounds of formula (Ih), tosylhydrazide may be mentioned.

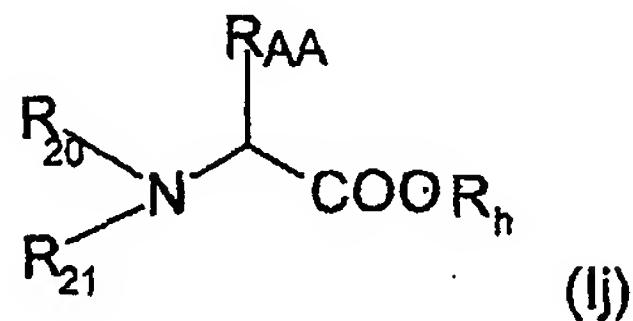

20 As other types of nucleophilic substrates, there may be mentioned the urea derivative such as the guanidines and which may be represented by formula (Ii):

in said formula (Ii), the groups  $R_{19}$ , which are identical 25 or different have the meaning given for  $R_1$  and  $R_2$  in formula (Ia).

As examples of compounds of formula (Ii),  $N,N,N',N'$ -tetramethylguanidine may be mentioned.

Another category of nucleophiles which may be used in the method of the invention are the amino acids and their derivatives:

5

in this formula:

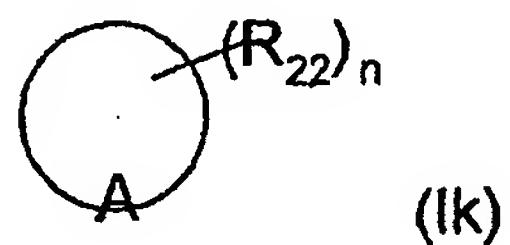

- $R_{AA}$  represents the residue of an amino acid, preferably a hydrogen atom, a linear or branched  $C_1$  to  $C_{12}$  alkyl group optionally carrying a functional group, a  $C_6$  to  $C_{12}$  aryl or arylalkyl group or a functional group, preferably a hydroxyl group,
- $R_{20}$  and  $R_{21}$  have the meaning given for  $R_1$  and  $R_2$  in formula (Ia),
- $R_h$  represents a hydrogen atom, a metal cation, preferably an alkali metal cation or a hydrocarbon group having from 1 to 12 carbon atoms, preferably a  $C_1$  to  $C_{12}$  alkyl group.

10 In formula (Ij),  $R_{AA}$  represents an alkyl group capable of carrying a functional group and there may be mentioned, inter alia, an  $-OH$ ,  $-NH_2$ ,  $-CO-NH_2$ ,  $-NH-CNH-$ ,  $-HN-C(O)-NH_2-$ ,  $-COOH$ ,  $-SH$  or  $-S-CH_3$  group, or an imidazole, pyrrole or pyrazole group.

15 25 There may be mentioned, as examples of amino acids, glycine, cysteine, aspartic acid, glutamic acid and histidine.

30 Nucleophilic substrates which are completely suitable for carrying out the method of the invention are heterocyclic derivatives comprising at least one nucleophilic atom such as a nitrogen, sulfur or phosphorus atom.

More specifically, they correspond to general formula (Ik):

in said formula (Ik):

5 - A symbolizes the residue of a ring forming all or part of a monocyclic or polycyclic, aromatic or nonaromatic heterocyclic system in which one of the carbon atoms is replaced by at least one nucleophilic atom such as a nitrogen, sulfur or 10 phosphorus atom,

-  $R_{22}$ , which are identical or different, represent substituents on the ring,

- n represents the number of substituents on the ring.

15 The invention applies in particular to the monocyclic heterocyclic compounds corresponding to formula (Ik) in which A symbolizes a saturated or unsaturated, or aromatic heterocycle containing in particular 5 or 6 atoms in the ring which may comprise from 1 to 3 20 heteroatoms, preferably nitrogen, sulfur and oxygen atoms, and in which at least one of them is a nucleophilic atom such as NH or S.

A may also represent a polycyclic heterocyclic compound 25 defined as consisting of at least 2 aromatic or non-aromatic heterocycles containing at least one heteroatom in each ring and forming with each other ortho- or ortho- and peri-fused systems or a group consisting of at least one aromatic or nonaromatic carbocycle and at least one 30 aromatic or nonaromatic heterocycle forming with each other ortho- or ortho- and peri-fused systems.

It is also possible to start with a substrate resulting from the linkage of a saturated, unsaturated or aromatic

heterocycle as mentioned above and a saturated, unsaturated or aromatic carbocycle. The expression carbocycle is preferably understood to mean a ring of the cycloaliphatic or aromatic type having from 3 to 8 carbon  
5 atoms, preferably 6.

It should be noted that the carbon atoms of the heterocycle may be optionally substituted, in their entirety or for some of them only with  $R_{22}$  groups.

10

The number of substituents present on the ring depends on the number of atoms in the ring and on the presence or absence of unsaturations in the ring.

15

The maximum number of substituents which may be carried by a ring is easily determined by persons skilled in the art.

20

In formula (Ik),  $n$  is a number less than or equal to 4, preferably equal to 0 or 1.

Examples of substituents are given below but this list does not imply any limitation.

25

The group(s)  $R_{22}$ , which are identical or different, preferably represent one of the following groups:

30

- a linear or branched alkyl group of  $C_1$  to  $C_6$ , preferably of  $C_1$  to  $C_4$  carbon atoms, such as methyl, ethyl, propyl, isopropyl, butyl, isobutyl, sec-butyl, tert-butyl,

- a linear or branched,  $C_2$  to  $C_6$ , preferably  $C_2$  to  $C_4$ , alkenyl or alkynyl group, such as vinyl, allyl,

35

- a linear or branched  $C_1$  to  $C_6$ , preferably  $C_1$  to  $C_4$ , alkoxy or thioether group such as the methoxy, ethoxy, propoxy, isopropoxy and butoxy groups, an

alkenyloxy group, preferably an allyloxy group or a phenoxy group,

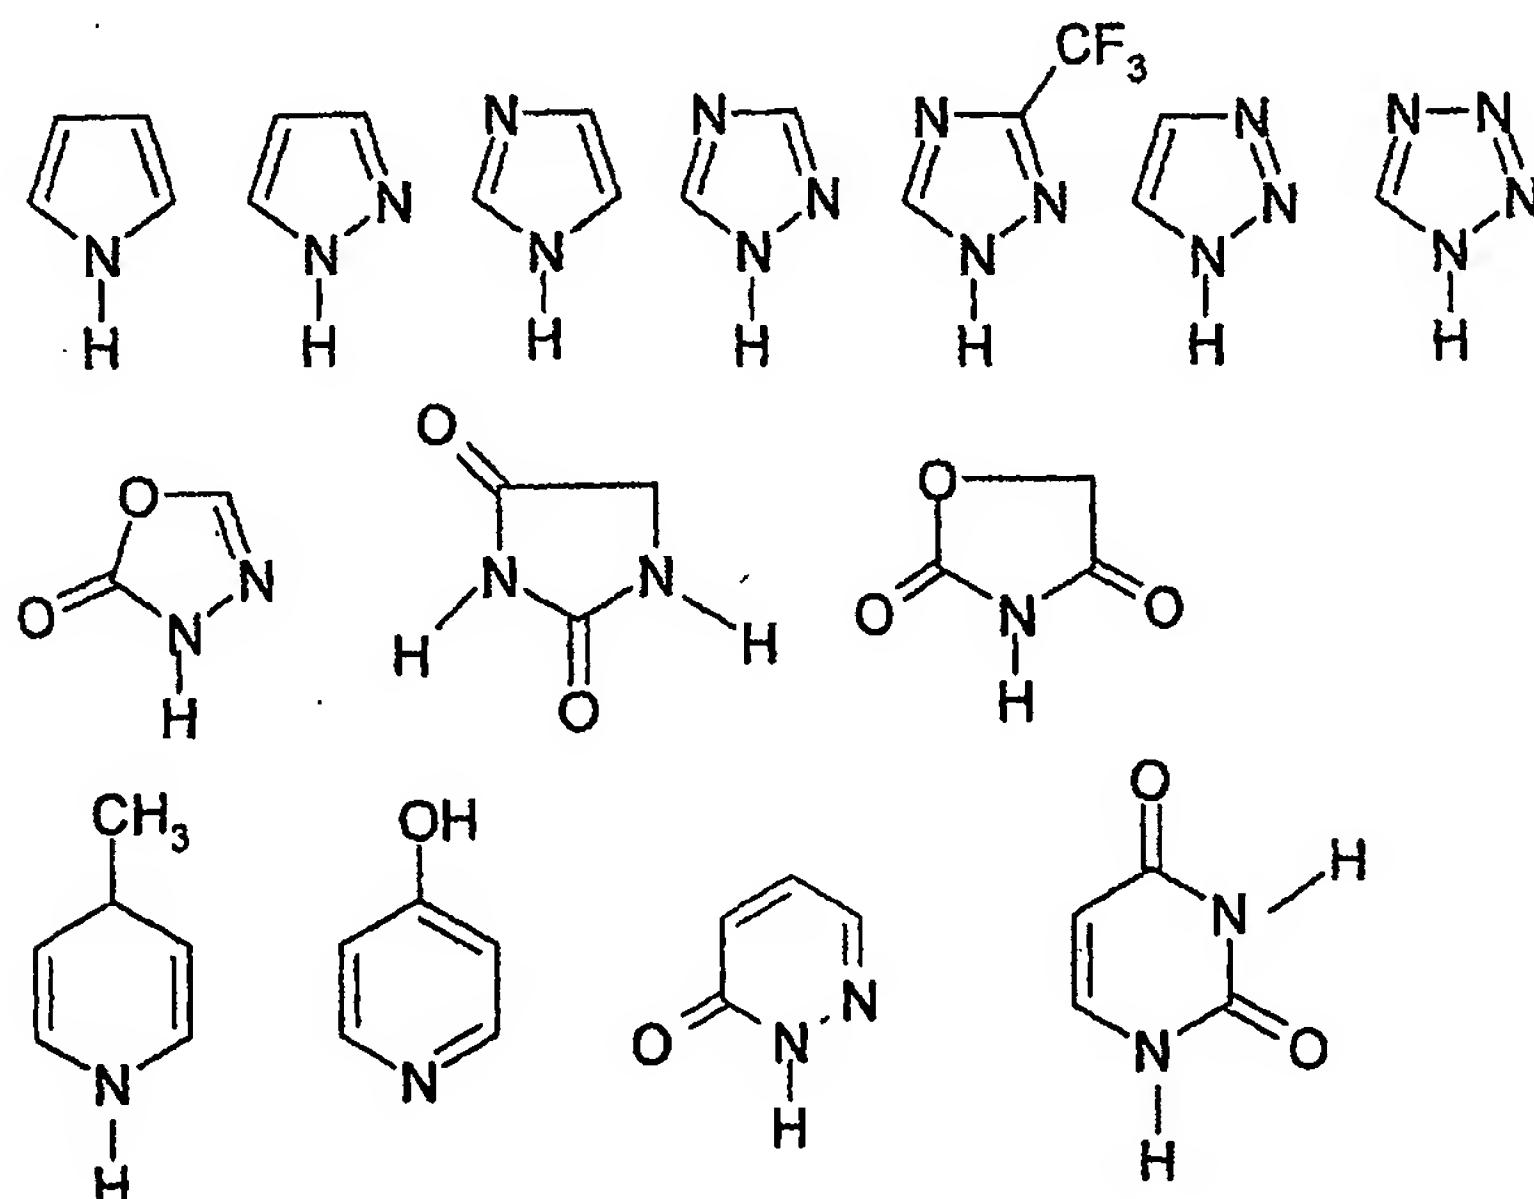

- a cyclohexyl, phenyl or benzyl group,
- a group or functional group such as: hydroxyl, thiol, carboxylic, ester, amide, formyl, acyl, aroyl, amide, urea, isocyanate, thioisocyanate, nitrile, azide, nitro, sulfone, sulfonic, halogen, pseudohalogen, trifluoromethyl.

5

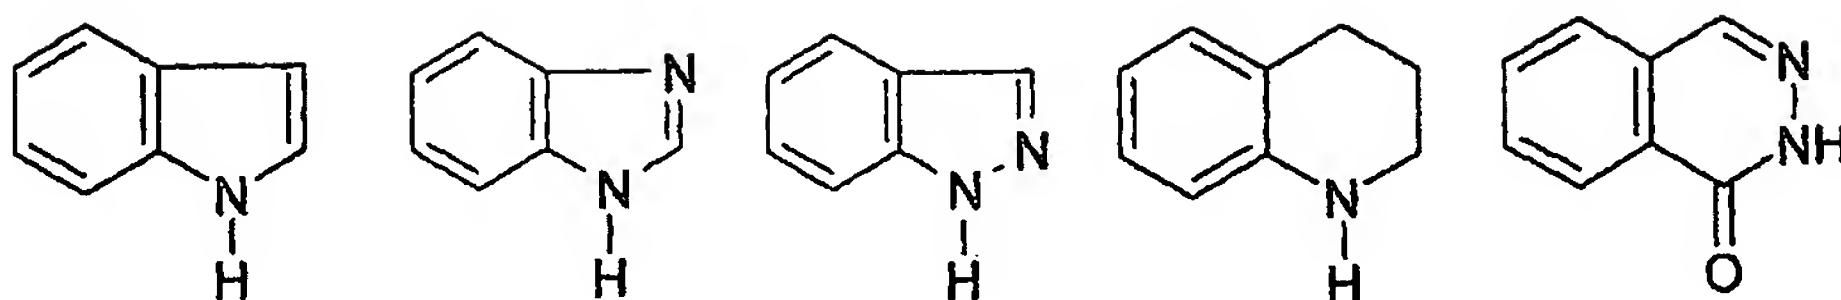

10 The present invention applies most particularly to the compounds corresponding to formula (Ik) in which the group(s)  $R_{22}$  represent more particularly an alkyl or alkoxy group.

15 More particularly, the optionally substituted residue A represents one of the following rings:

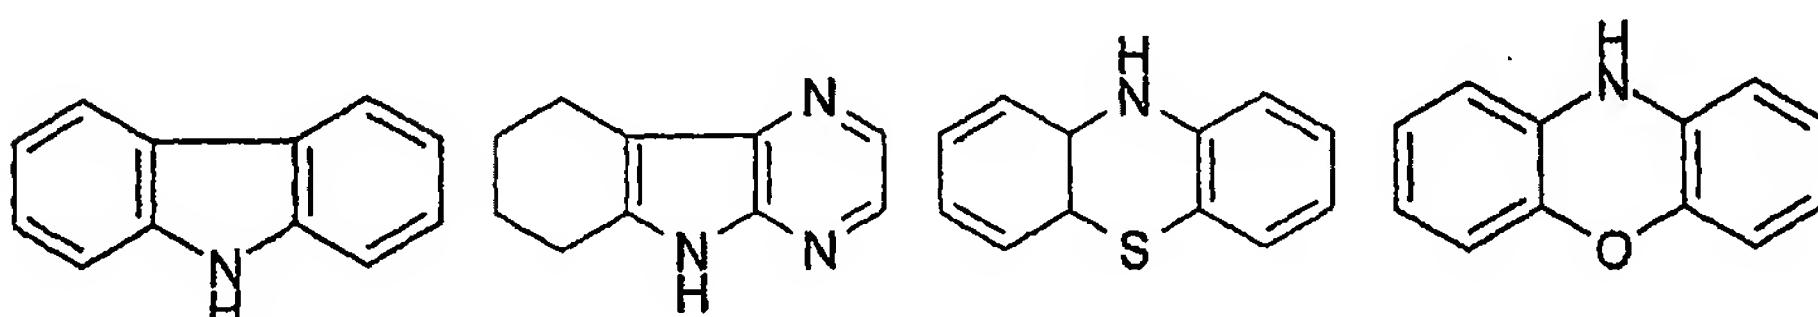

- a monocyclic heterocycle comprising one or more heteroatoms:

20 - a bicycle comprising a carbocycle and a heterocycle comprising one or more heteroatoms:

- a tricycle comprising at least one carbocycle or one heterocycle comprising one or more heteroatoms:

5 As examples of heterocyclic compounds, preference is given to the use of those which correspond to formula (Ik) in which A represents a ring such as: imidazole, pyrazole, triazole, pyrazine, oxadiazole, oxazole, tetrazole, indole, pyrrole, phthalazine, pyridazine,  
10 oxazolidine.

As regards the nucleophilic compounds which may also be used in the method of the invention, there may also be mentioned the compounds of alcohol type or of thiol type  
15 which may be represented by the following formula:

in said formula (Im):

- $R_{23}$  represents a hydrocarbon group having from 1 to 20 atoms and has the meaning given for  $R_1$  or  $R_2$  in formula (Ia),
- Z represents a group of the  $OM_1$  or  $SM_1$  type in which  $M_1$  represents a hydrogen atom or a metal cation, preferably an alkali metal cation.

25 The preferred compounds correspond to formula (Im) in which  $R_{23}$  represents a hydrocarbon group having from 1 to 20 carbon atoms which may be a saturated or unsaturated, linear or branched acyclic aliphatic group; a monocyclic or polycyclic, saturated, unsaturated or aromatic

carbocyclic or heterocyclic group; a succession of the abovementioned groups.

More specifically, R<sub>23</sub> preferably represents a saturated, 5 linear or branched acyclic aliphatic group preferably having from 1 to 12 carbon atoms, and more preferably still from 1 to 4 carbon atoms.

The invention does not exclude the presence of an 10 unsaturation on the hydrocarbon chain such as one or more double bonds which may be conjugated or nonconjugated, or a triple bond.

As mentioned for R<sub>1</sub> defined in formula (Ia), the hydro- 15 carbon chain may be optionally interrupted by a hetero- atom, a functional group or a group carrying one or more substituents.

In formula (Im), R<sub>23</sub> may also represent a saturated or 20 unsaturated carbocyclic group preferably having 5 or 6 carbon atoms in the ring; a saturated or unsaturated heterocyclic group containing in particular 5 or 6 atoms in the ring including 1 or 2 heteroatoms such as nitrogen, sulfur, oxygen or phosphorus atoms; a mono- 25 cyclic, aromatic carbocyclic or heterocyclic group, preferably phenyl, pyridyl, furyl, pyranyl, thiofenyl, thienyl, phospholyl, pyrazolyl, imidazolyl, pyrrolyl or a fused or nonfused polycyclic, aromatic carbocyclic or heterocyclic group, preferably naphthyl.

30 Since R<sub>23</sub> comprises a ring, the latter may also be substituted. The nature of the substituent may be any insofar as it does not interfere with the main reaction. The number of substituents is generally at most 4 per 35 ring but is most often equal to 1 or 2. Reference may be made to the definition of R<sub>22</sub> in formula (Ik).

The invention also relates to the case where  $R_{23}$  comprises a succession of aliphatic and/or cyclic, carbocyclic and/or heterocyclic groups.

5

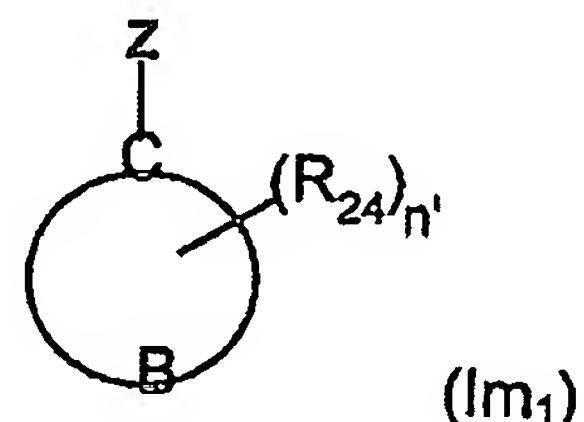

An acyclic aliphatic group may be attached to a ring by a valency bond, a heteroatom or a functional group such as oxy, carbonyl, carboxyl, sulfonyl and the like.

10 Reference may be made more particularly to the cyclo-alkylalkyl, for example cyclohexylalkyl, groups or the aralkyl groups having from 7 to 12 carbon atoms, in particular benzyl or phenylethyl groups.

15 The invention also envisages a succession of carbocyclic and/or heterocyclic groups, and more particularly a succession of phenyl groups separated by a valency bond or a functional atom or group such as: oxygen, sulfur, sulfo, sulfonyl, carbonyl, carbonyloxy, imino, 20 carbonylimino, hydrazo,  $C_1-C_{10}$ , preferably  $C_1$ , alkylenediimino.

25 The saturated or unsaturated, linear or branched acyclic aliphatic group may optionally carry a cyclic substituent. The expression ring is understood to mean a saturated, unsaturated or aromatic carbocyclic or heterocyclic ring.

30 The preferred compounds of formula (Im) correspond more particularly to general formula (Im<sub>1</sub>):

in which:

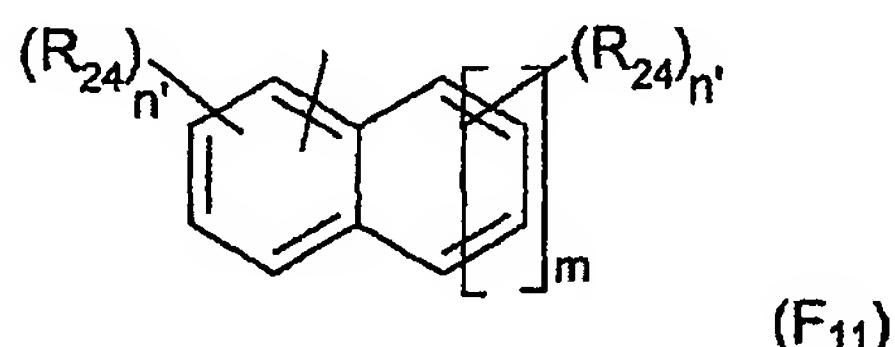

- B symbolizes the residue of a monocyclic or polycyclic aromatic carbocyclic group or a divalent group consisting of a succession of two or more monocyclic aromatic carbocyclic groups,
- $R_{24}$  represents one or more substituents which are identical or different,
- Z represents a group of the  $OM_1$  or  $SM_1$  type in which  $M_1$  represents a hydrogen atom or a metal cation, preferably an alkali metal cation,
- $n'$  is a number less than or equal to 5.

As examples of substituents  $R_{24}$ , reference may be made to those of formula  $R_{22}$  defined in formula (Ik).

15

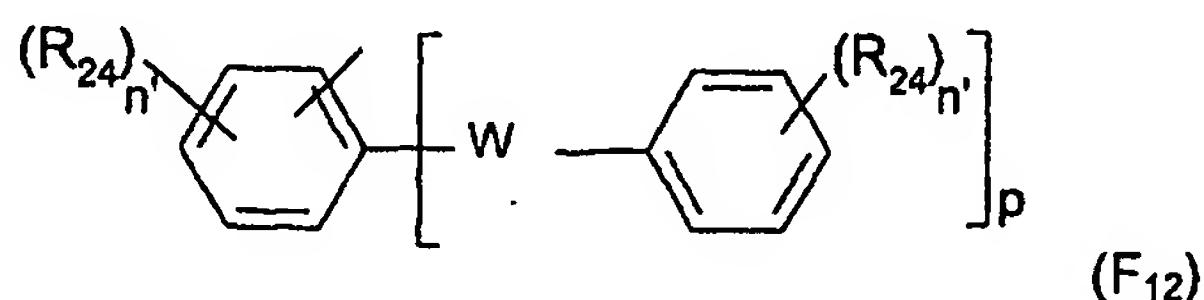

Among the compounds of formula  $(Im_1)$ , use is made more particularly of those in which the residue (B) represents:

- a monocyclic or polycyclic aromatic carbocyclic group with rings which can form with each other an ortho-fused system corresponding to formula  $(F_{11})$ :

in said formula  $(F_{11})$ ,  $m$  represents a number equal to 0, 1 or 2 and the symbols  $R_{24}$  and  $n'$ , which are identical or different, having the meaning given above,

- a group consisting of a succession of two or more monocyclic aromatic carbocyclic groups corresponding to formula  $(F_{12})$ :

30

in said formula ( $F_{12}$ ), the symbols  $R_{24}$  and  $n'$ , which are identical or different, have the meaning given above,  $p$  is a number equal to 0, 1, 2 or 3 and  $w$  represents a valency bond, an alkylene or alkylidene group of preferably  $C_1$  to  $C_4$ , a methylene or isopropylidene group or a functional group such as  $G$ .

The compounds of formula (Im) preferably used correspond to the formulae ( $F_{11}$ ) and ( $F_{12}$ ) in which:

- $R_{24}$  represents a hydrogen atom, a hydroxyl group, a  $-CHO$  group, a  $-NO_2$  group, a linear or branched alkyl or alkoxy group having from 1 to 6 carbon atoms, preferably from 1 to 4 carbon atoms, and more preferably methyl, ethyl, methoxy or ethoxy,
- $w$  symbolizes a valency bond, an alkylene or alkylidene group having from 1 to 4 carbon atoms or an oxygen atom,
- $m$  is equal to 0 or 1,
- $n'$  is equal to 0, 1 or 2,
- $p$  is equal to 0 or 1.

By way of illustration of compounds corresponding to formula (Im), there may be mentioned more particularly:

- those in which the residue B corresponds to formula ( $F_{11}$ ) in which  $m$  and  $n'$  are equal to 0, such as phenol, thiophenol,
- those in which the residue B corresponds to formula ( $F_{11}$ ) in which  $m$  is equal to 0 and  $n'$  is equal to 1, such as hydroquinone, pyrocatechol, resorcinol, alkylphenols, alkylthiophenols, alkoxyphenols, salicylic aldehyde, p-hydroxybenzaldehyde, methyl salicylate, methyl ester of p-hydroxybenzoic acid, chlorophenols, nitrophenols, p-acetamidophenol,
- those in which the residue B corresponds to formula ( $F_{11}$ ) in which  $m$  is equal to 0 and  $n'$  is equal to 2,

such as dialkylphenols, vanillin, isovanillin, 2-hydroxy-5-acetamidobenzaldehyde, 2-hydroxy-5-propionamidobenzaldehyde, 4-allyloxybenzaldehyde, dichlorophenols, methylhydroquinone,  
5 chlorohydroquinone,

- those in which the residue B corresponds to formula (F<sub>11</sub>) in which m is equal to 0 and n' is equal to 3, such as 4-bromovanillin, 4-hydroxyvanillin, trialkylphenols, 2,4,6-trinitrophenol, 2,6-dichloro-10 4-nitrophenol, trichlorophenols, dichlorohydroquinones, 3,5-dimethoxy-4-hydroxybenzaldehyde,

- those in which the residue B corresponds to formula (F<sub>11</sub>) in which m is equal to 1 and n' is equal to 1, such as dihydroxynaphthalene, 4-methoxy-1-naphthol, 15 6-bromo-2-naphthol,

- those in which the residue B corresponds to formula (F<sub>12</sub>) in which p is equal to 1 and n' is greater than or equal to 1, such as 2-phenoxyphenol, 3-phenoxyphenol, phenylhydroquinone,  
20 4,4'-dihydroxybiphenyl, 4,4'-isopropylidenediphenol (bisphenol-A), bis(4-hydroxyphenyl)methane, bis(4-hydroxyphenyl)sulfone, bis(4-hydroxyphenyl)sulfoxide, tetrabromobisphenol A.

25 As nucleophilic compounds of any other nature, there may also be mentioned the phosphorus-containing or phosphorus- and nitrogen-containing compounds, and more particularly those corresponding to the following formulae:

- the phosphides of formula (R<sub>25</sub>)<sub>2</sub>-P<sup>-</sup> (In)

- the phosphines of formula (R<sub>25</sub>)<sub>3</sub>-P (Io)

- the phosphonium azayldiides of formula (R<sub>25</sub>)<sub>3</sub>-P<sup>+</sup>-N<sup>2-</sup> (Ip)

35 - the phosphonium azaylides of formula (R<sub>25</sub>)<sub>3</sub>-P<sup>+</sup>-N<sup>-</sup>-R<sub>26</sub> (Iq)

in the formulae (In) to (Iq), the groups  $R_{25}$ , which are identical or different, and the group  $R_{26}$  represent:

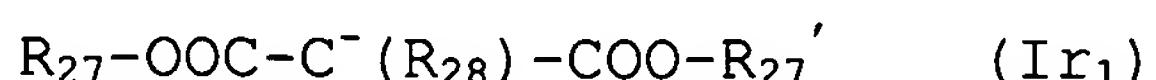

- 5 . an alkyl group having from 1 to 12 carbon atoms,
- 10 . a cycloalkyl group having 5 or 6 carbon atoms,
- 15 . a cycloalkyl group having 5 or 6 carbon atoms, substituted with one or more alkyl radicals having 1 to 4 carbon atoms, or alkoxy radicals having 1 or 4 carbon atoms,
- 20 . a phenylalkyl group in which the aliphatic part contains from 1 to 6 carbon atoms,
- 25 . a phenyl group,
- . a phenyl group substituted with one or more alkyl radicals having 1 to 4 carbon atoms or alkoxy radicals having from 1 to 4 carbon atoms or with one or more halogen atoms.

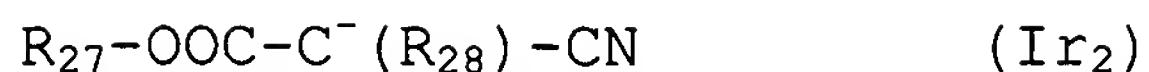

As more particular examples of phosphorus-containing compounds, there may be mentioned in particular tri-  
20 cyclohexylphosphine, trimethylphosphine, triethylphosphine, tri-*n*-butylphosphine, triisobutylphosphine, tri-*tert*-butylphosphine, tribenzylphosphine, dicyclohexylphenylphosphine, triphenylphosphine, dimethylphenylphosphine, diethylphenylphosphine, di-*tert*-butylphenylphosphine.  
25

Other nucleophilic compounds which may be used in the method of the invention are hydrocarbon derivatives comprising a nucleophilic carbon.

30 There may be mentioned more particularly malonate-type anions comprising an  $-OOC-HC^--COO-$  group.

There may be mentioned the alkyl malonate anions  
35 corresponding respectively to the formulae (Ir):

in said formulae (Ir<sub>1</sub>) and (Ir<sub>2</sub>):

- R<sub>27</sub> and R<sub>27'</sub>, which are identical or different, represent an alkyl group having from 1 to 12 atoms in the alkyl group, preferably from 1 to 4 atoms,
- 5 - R<sub>28</sub> represents:
  - . a hydrogen atom,
  - . an alkyl group having from 1 to 12 carbon atoms,
  - . a cycloalkyl group having 5 or 6 carbon atoms,
  - 10 . a cycloalkyl group having 5 or 6 carbon atoms, substituted with one or more alkyl radicals having 1 to 4 carbon atoms or alkoxy radicals having 1 or 4 carbon atoms,
  - . a phenyl group,
  - 15 . a phenyl group substituted with one or more alkyl radicals having 1 to 4 carbon atoms or alkoxy radicals having from 1 to 4 carbon atoms or with one or more halogen atoms,
  - . a phenylalkyl group in which the aliphatic part
  - 20 contains from 1 to 6 carbon atoms.

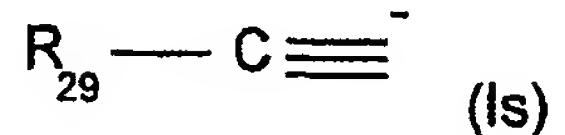

As examples, there may be mentioned in particular dimethyl or diethyl malonate.

25 Mention may also be made of the malodinitrile-type anions comprising a group NC-C<sup>-</sup>(R<sub>28</sub>)-CN in which R<sub>28</sub> has the definition given above.

30 Also suitable as nucleophilic compounds are the compounds comprising an anion CN<sup>-</sup> such as for example sodium or potassium cyanide or a generator of said anion such as, for example, ethanal cyanohydrin CH<sub>3</sub>CH(OH)CN or CH<sub>3</sub>C(CH<sub>3</sub>)(OH)CN.

35 Also capable of being used in the method of the invention are the acetylenide-type compounds.

They may be schematically represented by formula (Is):

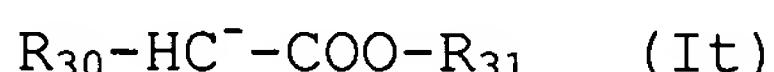

in said formula,  $R_{29}$  is of any nature and the counter-ion is a metal cation, preferably a sodium or potassium atom.

5

For the meaning of  $R_{29}$ , reference may be made to the meanings of  $R_1$ .

10 As more particular examples, there may be mentioned sodium or potassium acetylide or diacetylide.

15 As other classes of nucleophilic compounds which may be used in the method of the invention, there may be mentioned the profen-type compounds and derivatives which can be represented by the following formula:

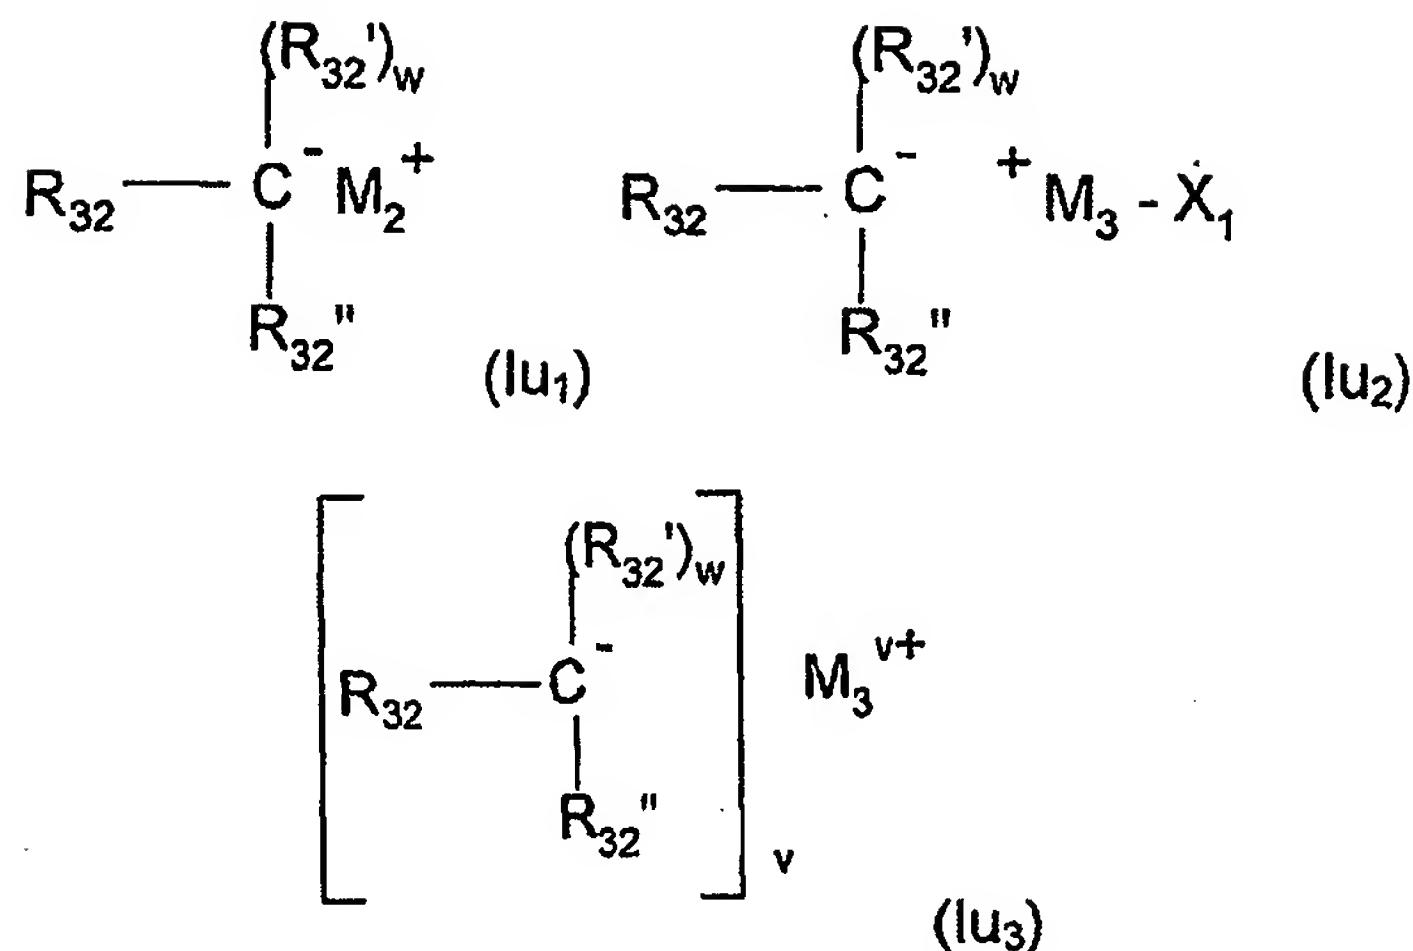

in said formula:

20 -  $R_{30}$  has the meaning given for  $R_1$ ,  
-  $R_{31}$  represents an alkyl group having from 1 to 12 atoms in the alkyl group, preferably from 1 to 4 atoms.

25 The preferred compounds are those which correspond to formula (It) in which  $R_{30}$  represents an alkyl group having from 1 to 12 carbon atoms, a cycloalkyl group having 5 or 6 carbon atoms and an aryl group having 6 or 12 carbon atoms, or a nitrogen-containing heterocycle having 5 or 6 atoms.

30 There may also be mentioned, as nucleophilic compounds, those comprising a carbanion and in which the counter-ion is a metal and corresponding to the following formulae:

in which:

- the group  $\text{R}_{32}$  represents:
  - 5 . an alkyl group having from 1 to 12 carbon atoms,
  - . a cycloalkyl group having 5 or 6 carbon atoms,
  - . a cycloalkyl group having 5 or 6 carbon atoms, which is substituted with one or more alkyl radicals having 1 to 4 carbon atoms or alkoxy radicals having 1 or 4 carbon atoms,
  - 10 . a phenylalkyl group in which the aliphatic part contains from 1 to 6 carbon atoms,
  - . a phenyl group,
  - . a phenyl group substituted with one or more alkyl radicals having 1 to 4 carbon atoms or alkoxy radicals having from 1 to 4 carbon atoms or with one or more halogen atoms,
  - 15 . a saturated, unsaturated or aromatic heterocyclic group preferably comprising 5 or 6 atoms and comprising, as heteroatom, sulfur, oxygen or nitrogen,
  - 20 - the groups  $\text{R}_{32}'$  and  $\text{R}_{32}''$  represent a hydrogen atom or a group such as  $\text{R}_{32}$ ,
  - two of the groups  $\text{R}_{32}$ ,  $\text{R}_{32}'$  and  $\text{R}_{32}''$  may be linked together to form a saturated, unsaturated or aromatic heterocycle preferably having 5 or 6 carbon atoms,
  - 25 -  $\text{M}_2$  represents a metal element in group (IA) of the

Periodic Table of Elements,

- $M_3$  represents a metal element in groups (IIA), (IIB) of the Periodic Table of Elements,
- $X_1$  represents a chlorine or bromine atom,
- 5 -  $v$  is the valency of the metal  $M_3$ ,
- $w$  is equal to 0 or 1.

In the present text, reference is made below to the Periodic Table of Elements published in the Bulletin de 10 la Société Chimique de France, No. 1 (1966).

Among the compounds of formula (Iu<sub>1</sub>) to (Iu<sub>3</sub>), those which are preferred involve, as metals, lithium, sodium, magnesium or zinc, and  $X_1$  represents a chlorine atom.

15

The groups  $R_{32}$ ,  $R_{32}'$  and  $R_{32}''$  are advantageously a C<sub>1</sub>-C<sub>4</sub> alkyl group, a cyclohexyl or phenyl group; or said groups may form a benzene, cyclopentadiene, pyridine or thiofene ring.

20

As examples, there may be mentioned n-butyllithium, t-butyllithium, phenyllithium, bromide or chloride of methyl- or ethyl- or phenylmagnesium, diphenylmagnesium, dimethyl- or diethylzinc, cyclopentadienezinc, chloride 25 or bromide of ethylzinc.

30

The preferred nucleophiles used in the method of the invention are the following: diphenylamine, N-methyl-N-phenylamine, benzophenone imine, benzophenone hydrazone, benzophenone oxime.

35

Aromatic compound

In accordance with the method of the invention, a -C-C- or -C-HE-(O, P, N) bond is created by reacting a nucleophilic compound with a compound comprising an 5 unsaturation at the  $\alpha$ -position of a leaving group.

More specifically, this involves a compound comprising a leaving group Y symbolized by the formula (II):

10 in said formula (II):

-  $R_0$  represents a hydrocarbon group comprising from 2 to 20 carbon atoms and possesses a double bond at the  $\alpha$ -position with respect to a leaving group Y or a monocyclic or polycyclic aromatic carbocyclic 15 and/or heterocyclic group carrying a leaving group Y on a ring.

In accordance with the method of the invention, the compound of formula (I) is reacted with a compound of 20 formula (II) in which:

-  $R_0$  represents an aliphatic hydrocarbon group comprising a double bond at the  $\alpha$ -position with respect to the leaving group or an unsaturated cyclic hydrocarbon group in which an unsaturation 25 carries the leaving group,

-  $R_0$  represents a monocyclic or polycyclic aromatic carbocyclic and/or heterocyclic group,

- Y represents a leaving group, preferably a halogen atom or a sulfonic ester group of formula  $-OSO_2-R_e$ , 30 in which  $R_e$  is a hydrocarbon group.

The compound of formula (II) will be designated, in the text which follows, by "compound carrying a leaving group".

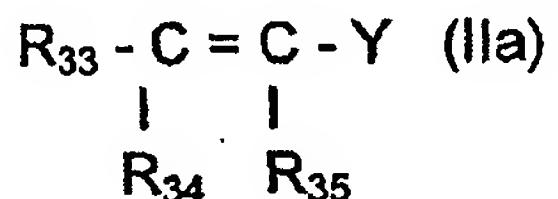

In the formula for the sulfonic ester group,  $R_e$  is a hydrocarbon group of any nature. However, given that  $Y$  is a leaving group, it is advantageous, from an economic point of view, for  $R_e$  to be of a simple nature, and 5 represent more particularly a linear or branched alkyl group having from 1 to 4 carbon atoms, preferably a methyl or ethyl group, but it may also represent, for example, a phenyl or tolyl group or a trifluoromethyl group. Among the groups  $Y$ , the preferred group is a 10 triflate group, which corresponds to a group  $R_e$  representing a trifluoromethyl group.

As preferred leaving groups, a bromine atom is preferably chosen.

15

The compounds of formula (II) most particularly desired according to the method of the invention may be classified into three groups:

- (1) those of the aliphatic type carrying a double 20 bond which may be represented by the formula (IIa):

in said formula (IIa):

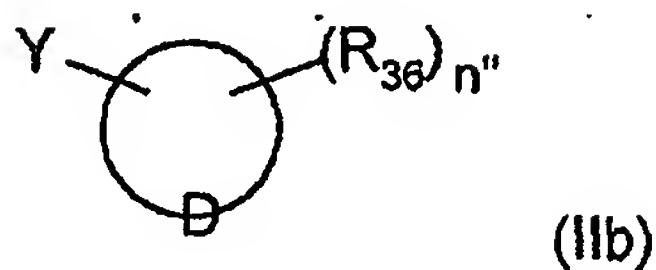

-  $R_{33}$ ,  $R_{34}$  and  $R_{35}$ , which are identical or different, represent a hydrogen atom or a hydrocarbon group having from 1 to 20 carbon atoms, which may be a saturated or unsaturated, linear or branched aliphatic group; a monocyclic or polycyclic, saturated, unsaturated or aromatic carbocyclic or heterocyclic group; a succession of aliphatic and/or carbocyclic and/or heterocyclic groups as mentioned above,

25

-  $Y$  symbolizes the leaving group as defined above,

- (2) those of the aromatic type which are designated, 30 in the text which follows, by "haloaromatic

compound" and which may be represented by the formula (IIb):

in which:

5        - D symbolizes the residue of a ring forming all or part of a monocyclic or polycyclic aromatic carbocyclic and/or heterocyclic system,

10      -  $R_{36}$ , which are identical or different, represent substituents on the ring,

10      - Y represents a leaving group as defined above,

10      -  $n''$  represents the number of substituents on the ring.

15      The invention applies to the unsaturated compounds corresponding to the formulae (IIa) in which  $R_{33}$  preferably represents a saturated, linear or branched acyclic aliphatic group preferably having from 1 to 12 carbon atoms.

20      The invention does not exclude the presence of another unsaturation in the hydrocarbon chain such as another triple bond or one or more double bonds which may be conjugated or unconjugated.

25      The hydrocarbon chain may be optionally interrupted by a heteroatom (for example oxygen or sulfur) or by a functional group insofar as the latter does not react, and there may be mentioned in particular a group such as in particular  $-CO-$ .

30      The hydrocarbon chain may optionally carry one or more substituents insofar as they do not react under the reaction conditions, and there may be mentioned in

particular a halogen atom, a nitrile group or a trifluoromethyl group.

5 The saturated or unsaturated, linear or branched acyclic aliphatic group may optionally carry a cyclic substituent. The expression ring is understood to mean a monocyclic or polycyclic, saturated, unsaturated or aromatic carbocyclic or heterocyclic ring.

10 The acyclic aliphatic group may be attached to the ring by a valency bond, a heteroatom or a functional group such as oxy, carbonyl, carboxyl, sulfonyl and the like.

15 As examples of cyclic substituents, it is possible to envisage cycloaliphatic, aromatic or heterocyclic substituents, in particular cycloaliphatic substituents comprising 6 carbon atoms in the ring or benzene substituents, these cyclic substituents themselves optionally carrying any substituent insofar as they do 20 not hamper the reactions which occur in the method of the invention. There may be mentioned in particular alkyl or alkoxy groups having from 1 to 4 carbon atoms.

25 Among the aliphatic groups carrying a cyclic substituent, reference may be made more particularly to the aralkyl groups having from 7 to 12 carbon atoms, in particular benzyl or phenylethyl.

30 In formula (IIa), a saturated or unsaturated carbocyclic group preferably having 5 or 6 carbon atoms in the ring, preferably cyclohexyl; a saturated or unsaturated heterocyclic group containing in particular 5 or 6 atoms in the ring including 1 or 2 heteroatoms such as nitrogen, sulfur and oxygen atoms; a monocyclic aromatic 35 carbocyclic group, preferably phenyl, or a fused or unfused polycyclic aromatic carbocyclic group, preferably

naphthyl, may also be represented.

As for  $R_{34}$  and  $R_{35}$ , they preferably represent a hydrogen atom or an alkyl group having from 1 to 12 carbon atoms,  
5 a phenyl group or an aralkyl group having from 7 to 12 carbon atoms, preferably a benzyl group.

In formula (IIa),  $R_{33}$ ,  $R_{34}$  and  $R_{35}$  represent more particularly a hydrogen atom or  $R_{33}$  represents a phenyl  
10 group, and  $R_{34}$  and  $R_{35}$  represent a hydrogen atom.

It should also be noted that the groups  $R_{33}$  and  $R_{34}$  may also represent a functional group insofar as the latter does not interfere with the coupling reaction. Functional  
15 groups such as amido, ester, ether and cyano may be mentioned as examples.

As examples of compounds corresponding to formulae (IIa), there may be mentioned in particular vinyl chloride or  
20 bromide or  $\beta$ -bromo- or  $\beta$ -chlorostyrene.

The invention applies in particular to the haloaromatic compounds corresponding to formula (IIb) in which D is the residue of a cyclic compound preferably having at  
25 least 4 atoms in the ring, preferably 5 or 6, which is optionally substituted, and representing at least one of the following rings:

- a monocyclic or polycyclic aromatic carbocycle, that is to say a compound consisting of at least 2 aromatic carbocycles and forming with each other ortho- or ortho- and peri-fused systems or a compound consisting of at least 2 carbocycles only one of which is aromatic and forming with each other ortho- or ortho- and peri-fused systems,
- 30 • a monocyclic aromatic heterocycle containing at least one of the heteroatoms P, O, N and S or a

polycyclic aromatic heterocycle, that is to say a compound consisting of at least 2 heterocycles containing at least one heteroatom in each ring in which at least one of the two rings is aromatic and forming with each other ortho- or ortho- and peri-fused systems or a compound consisting of at least one carbocycle and at least one heterocycle in which at least one of the rings is aromatic and forming with each other ortho- or ortho- and peri-fused systems.

More particularly, the optionally substituted residue D preferably represents the residue of an aromatic carbocycle such as benzene, of an aromatic bicyclic comprising 15 two aromatic carbocycles such as naphthalene; a partially aromatic bicyclic comprising two carbocycles one of which is aromatic, such as 1,2,3,4-tetrahydronaphthalene.

The invention also envisages the fact that D may 20 represent the residue of a heterocycle insofar as it is more electrophilic than the compound corresponding to formula (Ik).

As specific examples, there may be mentioned an aromatic 25 heterocycle such as furan, pyridine; an aromatic bicyclic comprising an aromatic carbocycle and an aromatic heterocycle such as benzofuran, benzopyridine, a partially aromatic bicyclic comprising an aromatic carbocycle and a heterocycle such as 30 methylenedioxybenzene; an aromatic bicyclic comprising two aromatic heterocycles such as 1,8-naphthypyridine; a partially aromatic bicyclic comprising a carbocycle and an aromatic heterocycle such as 5,6,7,8-tetrahydroquinoline.

35 In the method of the invention, a haloaromatic compound of formula (IIb) is preferably used in which D represents

an aromatic nucleus, preferably a benzene or naphthalene nucleus.

5 The aromatic compound of formula (IIb) may carry one or more substituents.

In the present text, the expression "more" is generally understood to mean less than 4 substituents  $R_{36}$  on an aromatic nucleus.

10

For examples of substituents, reference may be made to the meaning given for  $R_{22}$  in formula (Ik).

15

$R_{36}$  also represents a saturated, unsaturated or aromatic heterocycle comprising 5 or 6 atoms and comprising, as heteroatom, sulfur, oxygen or nitrogen. The pyrazolyl or imidazolyl groups may be mentioned in particular.

20

In formula (IIb),  $n''$  is a number less than or equal to 4, preferably equal to 1 or 2.

25

As examples of compounds corresponding to formula (IIb), there may be mentioned in particular bromobenzene, iodobenzene, p-chlorotoluene, p-bromoanisole, p-bromotrifluorobenzene.

30

The quantity of the unsaturated compound carrying a leaving group of formula (II), preferably of formula (IIa) or (IIb) or used is generally expressed relative to the quantity of the nucleophilic compound close to stoichiometry. Thus, the ratio between the number of moles of the unsaturated compound carrying the leaving group and the number of moles of the nucleophilic compound varies most often between 0.1 and 2.0, preferably between 0.5 and 1.5.

Catalyst

In accordance with the method of the invention, the nucleophilic compound preferably corresponding to 5 formulae (Ia) to (Iu<sub>3</sub>) is reacted with a compound carrying a leaving group corresponding to formula (II), preferably of formula (IIa) or (IIb) in the presence of an effective quantity of a copper-based catalyst and a base.

10 As examples of catalysts capable of being used, there may be mentioned metallic copper or the organic or inorganic compounds of copper(I) or copper (II).

15 The catalysts used in the method of the invention are known products.

By way of examples of catalysts of the invention, there may be mentioned in particular, as copper compounds, copper(I) bromide, copper(II) bromide, copper(I) iodide, 20 copper(I) chloride, copper(II) chloride, basic copper(II) carbonate, copper(I) nitrate, copper(II) nitrate, copper(I) sulfate, copper(II) sulfate, copper(I) sulfite, copper(I) oxide, copper(II) oxide, copper(I) acetate, copper(II) acetate, copper(II) trifluoromethylsulfonate, 25 copper(II) hydroxide, copper(I) methoxide, copper(II) methoxide, chlorocopper(II) methoxide of formula ClCuOCH<sub>3</sub>.

Copper(I) iodide is preferably chosen.

30 The quantity of catalyst used, expressed by the molar ratio between the number of moles of copper catalyst expressed as copper and the number of moles of compound carrying the leaving group generally varies between 0.001 and 0.2, preferably between 0.01 and 0.1.

Base

Also involved in the method of the invention is a base whose role is to trap the leaving group.

5

The characteristic of the base is that it has a pKa at least greater than or equal to 4, preferably between 6 and 30.

10 The pKa is defined as the ionic dissociation constant of the acid/base pair when water is used as solvent.

For the choice of a base having a pKa as defined by the invention, reference may be made, *inter alia*, to *Handbook 15 of Chemistry and Physics*, 66th edition, p. D-161 and D-162.

Among the bases which can be used, there may be mentioned, *inter alia*, the inorganic bases such as the 20 carbonates, hydrogen carbonates, phosphates or hydroxides of alkali metals, preferably of sodium, potassium or cesium, or of alkaline-earth metals, preferably calcium, barium or magnesium.

25 It is also possible to use the alkali metal hydrides, preferably sodium hydride, or the alcoholates of alkali metals, preferably of sodium or potassium, and more preferably sodium methoxide, ethoxide or tert-butoxide.

30 Also suitable are organic bases such as the tertiary amines and there may be mentioned more particularly triethylamine, tri-*n*-propylamine, tri-*n*-butylamine, methyldibutylamine, methyldicyclohexylamine, ethyldi-isopropylamine, N,N-diethylcyclohexylamine, pyridine, 35 4-dimethylaminopyridine, N-methylpiperidine, N-ethyl-piperidine, N-*n*-butylpiperidine, 1,2-dimethylpiperidine,

N-methylpyrrolidine, 1,2-dimethylpyrrolidine.

Among the bases, the alkali metal carbonates are preferably chosen.

5

The quantity of base used is such that the ratio between the number of moles of base and the number of moles of the aromatic compound carrying the leaving group preferably varies between 1 and 4, preferably in the 10 region of 2.

Nitrile-type solvent

In accordance with the method of the invention, the 15 arylation or vinylation reaction carried out according to the invention is carried out in a nitrile-type solvent which may be symbolized by the following formula:

in said formula (III):

20 -  $R_h$  represents a hydrocarbon group comprising at least one nitrile group, having from 1 to 24 carbon atoms, optionally substituted, which may be a saturated or unsaturated, linear or branched acyclic aliphatic group; a monocyclic or polycyclic, saturated, 25 unsaturated or aromatic cycloaliphatic group; a saturated or unsaturated, linear or branched aliphatic group, carrying a cyclic substituent.

The solvent preferably chosen corresponds to formula 30 (III) in which  $R_h$  represents a saturated or unsaturated, linear or branched acyclic aliphatic group.

$R_h$  preferably represents a saturated, linear or branched acyclic aliphatic group preferably having from 1 to 12 35 carbon atoms.

The invention does not exclude the presence of an unsaturation in the hydrocarbon chain such as a double or triple bond or one or more double bonds which may be conjugated or unconjugated.

5

The hydrocarbon chain may be optionally interrupted by a heteroatom (for example oxygen or sulfur) or by a functional group insofar as it does not react and there may be mentioned in particular a group such as especially  
10 -CO-.

The hydrocarbon chain may optionally carry one of the following substituents: -OR<sub>i</sub>, -NR<sub>i</sub>R<sub>i</sub> in these formulae, the groups R<sub>i</sub>, which are identical or different, represent  
15 hydrogen or a linear or branched alkyl group having from 1 to 4 carbon atoms, preferably a methyl or ethyl group or a phenyl group.

20 The saturated or unsaturated, linear or branched acyclic aliphatic group may optionally carry a cyclic substituent. The expression ring is understood to mean a saturated, unsaturated or aromatic carbocyclic or heterocyclic ring.

25 The acyclic aliphatic group may be attached to the ring by a valency bond, a heteroatom or a functional group such as oxy, carbonyl, carboxyl, sulfonyl and the like.

30 The saturated or unsaturated, linear or branched acyclic aliphatic residue may optionally carry a cyclic substituent. The expression ring is understood to mean a saturated, unsaturated or aromatic carbocyclic or heterocyclic ring.

35 The acyclic aliphatic residue may be attached to the ring by a valency bond or by an atom or a functional group,

for example -O-.

As examples of cyclic substituents, it is possible to envisage cycloaliphatic, aromatic or heterocyclic substituents, in particular cycloaliphatic substituents comprising 6 carbon atoms in the ring, or benzene or heterocyclic substituents comprising 5 or 6 atoms in the ring including one or two heteroatoms such as nitrogen (not substituted with a hydrogen atom), sulfur and oxygen atoms. It is possible for there to be a substituent insofar as they do not interfere with the coupling reaction. There may be mentioned in particular the alkyl or alkoxy groups having from 1 to 4 carbon atoms.

15 In general formula (III),  $R_h$  may also represent a saturated carbocyclic group or a group comprising 1 or 2 unsaturations in the ring, generally having from 3 to 7 carbon atoms, preferably 6 carbon atoms in the ring; it being possible for said ring to be substituted with 1 to 20 5 groups  $R_5$ , preferably 1 to 3,  $R_5$  having the meanings set out above.

As preferred examples of groups  $R_h$ , there may be mentioned the cyclohexyl or cyclohexenyl groups, optionally substituted with linear or branched alkyl groups having from 1 to 4 carbon atoms.

In general formula (III),  $R_h$  may also represent an aromatic group, preferably a group having 6 carbon atoms.

30 The solvents used may be of the mono- or polynitrile type. It is also possible to use a mixture of solvents.

As examples of solvents used, aliphatic or aromatic nitriles, preferably acetonitrile, propionitrile, butanenitrile, isobutanenitrile, pentanenitrile,

2-methylglutaronitrile, adiponitrile, benzonitrile, tolunitrile, malonitrile, 1,4-benzonitrile, are used.

5 The quantity of organic solvent to be used is determined according to the nature of the organic solvent chosen.

10 It is determined such that the concentration of the compound carrying the leaving group in the organic solvent is preferably between 0.5 and 2 mol/liter of organic solvent.

15 The arylation or vinylation reaction of the nucleophilic compound takes place at a temperature which is advantageously between 0°C and 120°C, preferably between 20°C and 100°C, and more preferably still between 25°C and 80°C.

20 The arylation or vinylation reaction is generally used under atmospheric pressure, but it is also possible to use higher pressures which may be up to for example 10 bar.

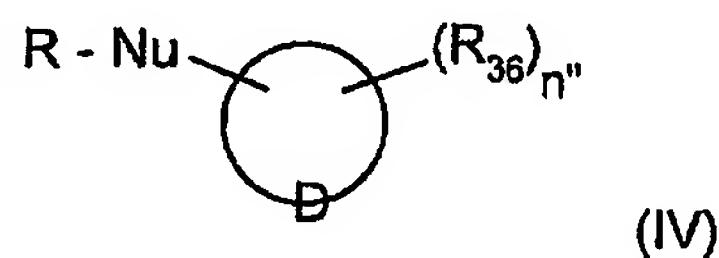

25 From a practical point of view, the reaction is simple to carry out.

30 The order in which the reagents are used is not critical. Preferably, the catalyst, preferably the copper catalyst, the nucleophilic compound of formula (I), the base, the compound carrying the leaving group of formula (II) and the organic solvent are loaded.

The reaction medium is brought to the desired temperature.

35 The progress of the reaction is checked by monitoring the disappearance of the compound carrying the leaving group.

At the end of the reaction, a product of the R-Nu-R<sub>0</sub> type is obtained, R representing the residue of the nucleophilic compound, and more particularly an arylated 5 product comprising the residue of the nucleophilic compound and the residue of the electrophilic compound which preferably corresponds to the following formula (IV):

10 in said formula (IV), D, R, R<sub>36</sub> and n'' have the meaning given above and Nu represents an oxygen or nitrogen atom.

The compound obtained is recovered according to the conventional techniques used, in particular by 15 crystallization from an organic solvent.

As more specific examples of organic solvents, there may be mentioned in particular halogenated or nonhalogenated aliphatic or aromatic hydrocarbons, carboxamides, 20 nitriles. There may be mentioned in particular cyclohexane, toluene, dimethylformamide, acetonitrile or dichloromethane.

It is also possible to recover the product on a silica 25 chromatography column.

Exemplary embodiments of the invention are given below. These examples are given as a guide, with no limitation being implied.

30

Before detailing the examples, an operating protocol is given which is repeated in all the examples, unless otherwise stated.

In the examples, the rate of conversion (RC) corresponds to the ratio between the number of substrate converted and the number of moles of substrate used.

5

The yield (AY) corresponds to the ratio between the number of moles of product formed and the number of moles of substrate used.

10 Examples

Two different procedures are given depending on the physical form, a solid or a liquid, of the nucleophilic compound and of the arylation agent.

15

Operating protocol A: Case of a solid nucleophilic compound and a liquid arylation agent

20 Copper(I) oxide (14.4 mg; 0.1 mmol) or copper(I) iodide (19.04 mg; 0.1 mmol), 2 or 3 mmol of nucleophilic compound (1 or 1.5 equivalents) and 1.303 g of cesium carbonate (4 mmol) are successively introduced into a 35 ml Schlenk tube, previously dried in an oven at 100°C, provided with a magnetic stirrer bar (12 × 4.5 mm) and 25 placed under a nitrogen atmosphere.

30 The Schlenk tube is purged under vacuum and then filled again with nitrogen. 2 or 3 mmol of arylation agent (1 or 1.5 equivalents) and then 1.2 ml of anhydrous acetonitrile are then added thereto by means of syringes.

The reactor is placed in an oil bath at the temperature of 82°C and stirred for a period varying from one to five days.

35

At the end of this period, the reaction mixture is

diluted with 25 ml of dichloromethane, filtered on celite, totally concentrated under reduced pressure and then taken up in 50 ml of dichloromethane.

5 This organic phase is extracted with distilled water (2 × 20 ml).

The aqueous phase is re-extracted with 20 ml of dichloromethane.

10

The overall organic phase is washed with a saturated aqueous sodium chloride solution (2 × 20 ml), dried over MgSO<sub>4</sub>, filtered and concentrated under reduced pressure.

15 The residue obtained is purified by chromatography on a silica column (35-70 µm).

Operating protocol B: Case of a liquid nucleophilic compound and a liquid arylation agent

20

Copper(I) oxide or copper(I) iodide and cesium carbonate are successively introduced into a 35 ml Schlenk tube, previously dried in an oven at 100°C, provided with a magnetic stirrer bar (12 × 4.5 mm) and placed under a 25 nitrogen atmosphere.

The Schlenk tube is purged under vacuum and then filled again with nitrogen.

30 The nucleophilic compound, the arylation agent and 1.2 ml of anhydrous acetonitrile are then added thereto by means of syringes.

The subsequent steps are rigorously identical to those of

35 the general procedure A.

Example 1: Arylation of nitrogen-containing nucleophilic compounds

Example 1.1:

5

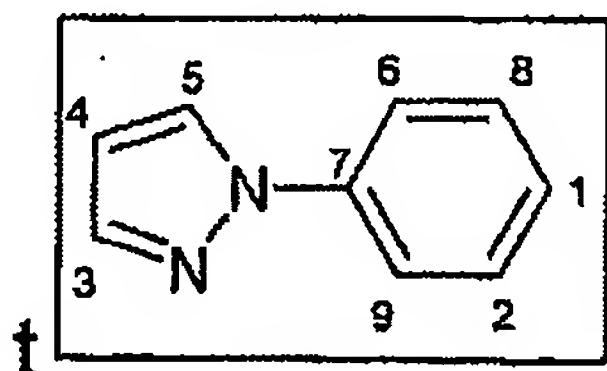

Synthesis of 1-phenyl-1H-pyrazole:

The general procedure A (CuI, 82°C, 24 hours) was followed using 211 µl of bromobenzene (2 mmol), 204 mg of 10 pyrazole (3 mmol) and 1.2 ml of acetonitrile.

The residue obtained was purified by chromatography on a silica column (eluent: hexane/dichloromethane 90/10 to 70/30). Yield: 65% (colorless oil).

15

The compound obtained corresponds to the following formula:

The characteristics are the following:

20

- **b.p.:** 58°C under 0.2 mmHg.

- **<sup>1</sup>H NMR/CDCl<sub>3</sub> (250 MHz):** δ 7.92 (dd, 1H, <sup>3</sup>J<sub>HH</sub> = 2.4 Hz, <sup>4</sup>J<sub>HH</sub> = 0.5 Hz, H<sub>5</sub>), 7.70 (m, 3H, H<sub>3,6,9</sub>), 7.45 (m, 2H, H<sub>2,8</sub>), 7.29 (m, 1H, H<sub>1</sub>), 6.46 (dd, 1H, <sup>3</sup>J<sub>HH</sub> = 2.4 Hz, <sup>3</sup>J<sub>HH</sub> = 1.8 Hz, H<sub>4</sub>).

25

- **<sup>13</sup>C NMR/CDCl<sub>3</sub>:** δ 141.08 (C<sub>3</sub>), 140.23 (C<sub>7</sub>), 129.43 (C<sub>2,8</sub>), 126.75 (C<sub>5</sub>), 126.44 (C<sub>1</sub>), 119.21 (C<sub>6,9</sub>), 107.61 (C<sub>4</sub>).

- **GC/MS:** tr = 13.15 min, M/Z = 144, purity = 100%.

- **IR (KBr):** ν (cm<sup>-1</sup>) = 3142, 3121 and 3150 (ff, aromatic), 1601, 1521 and 1501 (FF), 1464 (f), 1393 and 1332 (FF),

30

1253 (f), 1198 and 1120 (F), 1074 (f), 1046 (FF), 1036 (F), 936 (FF), 915 and 905 (f), 756 (FF).

**Rf** = 0.40 (eluent: dichloromethane/petroleum ether

60/40).

Examples 1.2 to 1.4:

5 In this series of tests, the operating protocol A is repeated under the following conditions: 0.5 mmol of phenyl iodide (1.67 M), 1.5 equivalents of nitrogen-containing nucleophilic compound, 10% of CuI and 2 equivalents of  $\text{CsCO}_3$  in the acetonitrile solvent.

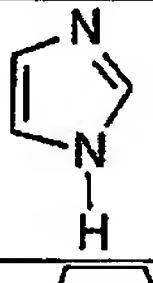

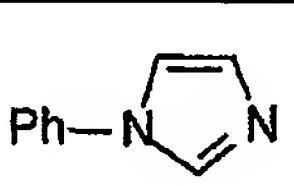

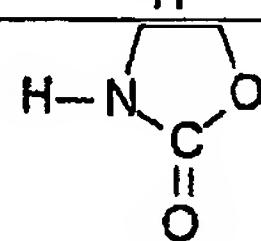

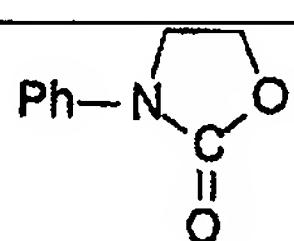

10

The reaction temperature is  $82^\circ\text{C}$  and the duration of the reaction is 24 hours.

The results are presented in the following table:

15

Table (I)

Ref. ex.	Haloaromatic compound	Nucleophilic compound	Product obtained	Yield
1.2	Ph-I			57
1.3	Ph-I			41
1.4	Ph-I	Ph- $\text{SO}_2\text{-NH}_2$	Ph- $\text{SO}_2\text{-NH-Ph}$	25

20 Example 2: Arylation of oxygenated nucleophilic compounds:

Example 2.1:

Synthesis of 3,5-dimethylphenyl and phenyl ether

25

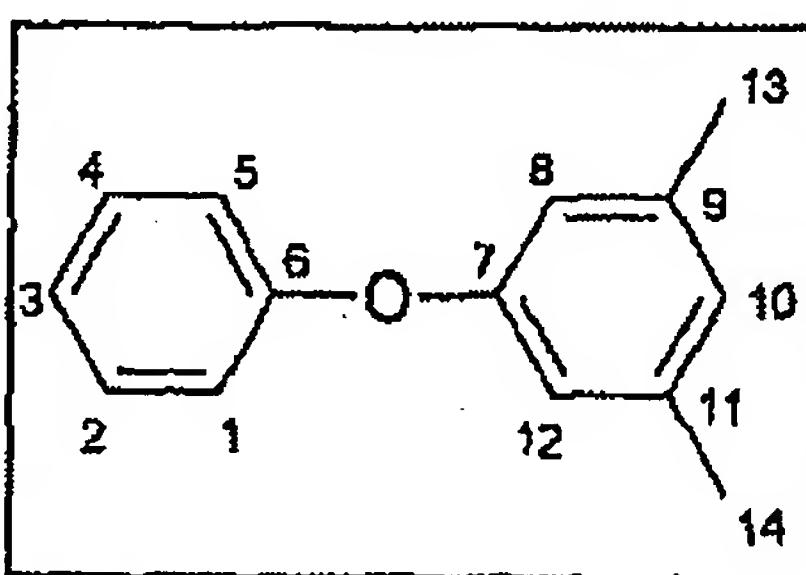

The general procedure A ( $\text{Cu}_2\text{O}$ ,  $82^\circ\text{C}$ , 29 hours) was followed using 336  $\mu\text{l}$  of iodobenzene (3 mmol), 244 mg of 3,5-dimethylphenol (2 mmol), 600 mg of ground and

activated 3 Å molecular sieve and 1.2 ml of acetonitrile.

The brown oil obtained at the end of the treatment was purified by chromatography on a silica column (eluent: 5 hexane).

The yield obtained is 71% (colorless oil).

10 The compound obtained corresponds to the following formula:

The characteristics are the following:

- **<sup>1</sup>H NMR/CDCl<sub>3</sub>**: δ 7.28-7.42 (m, 2H, H<sub>2,4</sub>), 7.12-7.17 (m, 1H, H<sub>3</sub>), 7.03-7.14 (m, 2H, H<sub>1,5</sub>), 6.79 (m, 1H, H<sub>10</sub>), 6.69 (m, 2H, H<sub>8,12</sub>), 2.33 (s, 6H, H<sub>13,14</sub>).
- **<sup>13</sup>C NMR/CDCl<sub>3</sub>**: δ 157.50 (C<sub>6</sub>), 157.22 (C<sub>7</sub>), 139.61 (C<sub>9,11</sub>), 129.70 (C<sub>2,4</sub>), 125.04 (C<sub>10</sub>), 123.02 (C<sub>3</sub>), 118.89 (C<sub>1,5</sub>), 116.67 (C<sub>8,12</sub>), 21.35 (C<sub>13</sub>).
- **GC/MS**: tr = 16.87 min, M/Z = 198, purity = 98%.
- 20 - **Rf** = 0.19 (eluent: hexane).

Example 3: Arylation of nucleophilic carbon compounds:

Example 3.1:

25

Synthesis of diethyl 2-phenylmalonate

The general procedure B (70 °C, 24 hours) was followed using 38 mg of copper(I) iodide (0.2 mmol), 224 µl of 30 iodobenzene (2 mmol), 607 µl of diethyl malonate

(4 mmol), 600 mg of ground and activated 3 Å molecular sieve, 977 mg of cesium carbonate (3 mmol) and 1.2 ml of acetonitrile.

5 The reaction mixture is neutralized with 6 ml of a 1 N aqueous hydrochloric acid solution before being filtered on celite.

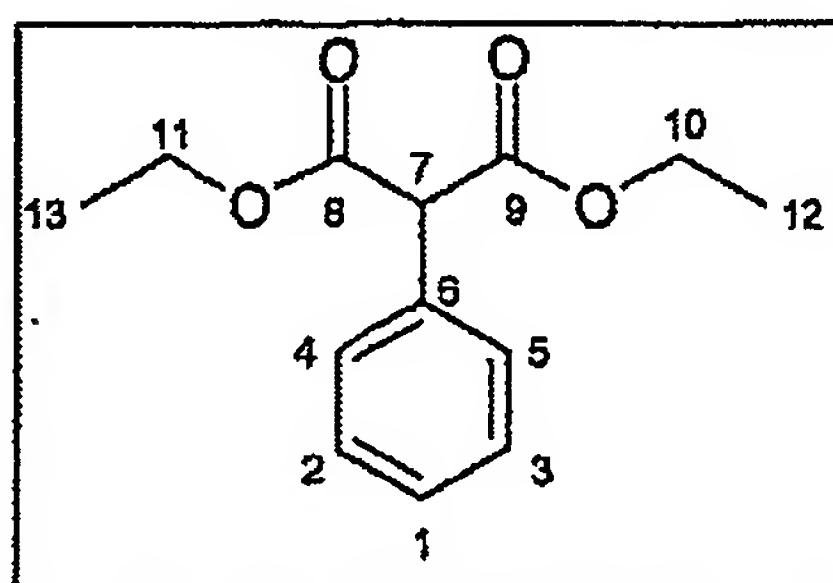

10 The filtrate is extracted with dichloromethane and then concentrated under reduced pressure.

The residue obtained was purified directly by chromatography on a silica column (eluent: hexane/dichloromethane 100/0 to 80/20).

15

The yield obtained is 53% (colorless oil).

The compound obtained corresponds to the following formula:

20

The characteristics are the following:

- **<sup>1</sup>H NMR/CDCl<sub>3</sub>**:  $\delta$  7.32-7.42 (m, 5H, H<sub>1,5</sub>), 4.62 (s, 1H, H<sub>7</sub>), 4.22 (m, 4H, H<sub>10,11</sub>), 1.26 (t, 6H,  $^3J_{HH} = 7.1$  Hz, H<sub>12,13</sub>). The protons of each methylene fragment of the ester functional group are diastereotopic and lead to the obtaining of an unresolved complex of the second order, which was not analyzed.

- **<sup>13</sup>C NMR/CDCl<sub>3</sub>**:  $\delta$  168.15 (C<sub>8,9</sub>), 132.86 (C<sub>6</sub>), 129.27 (C<sub>2,3</sub>), 128.58 (C<sub>4,5</sub>), 128.18 (C<sub>1</sub>), 61.77 (C<sub>11,12</sub>), 58.00 (C<sub>7</sub>), 14.00 (C<sub>12,13</sub>).

- 52 -

- **GC/MS:** tr = 16.77 min, M/Z = 236, purity = 99%.
- **Rf** = 0.27 (eluent: hexane/dichloromethane 70/30).
